Louisville, Kentucky 40202-2232**

FEBRUARY 2007

CERTIFICATION

All information/documentation provided accurately reflects the environmental condition of the property. This ECP Report is in general accordance with the U.S. Department of Defense (DOD) requirements for completion of an Environmental Condition of Property (ECP) Report.

STEVEN FRANCIS
Chief, Environmental Division
Deputy Chief of Staff
Installation Management
81st Regional Readiness Command

DATE

The undersigned certifies the contents of this report are in general accordance with DoD policies for the completion of an ECP.

EXECUTIVE SUMMARY

Fuller, Mossbarger, Scott and May Engineers, Inc. (FMSM), under contract to the U.S. Army Corps of Engineers (USACE), Louisville District, has prepared this Environmental Condition of Property (ECP) Report for the Adrian B. Rhodes Armed Forces Reserve Center (NC045), hereafter referred to as the "Site" or "AFR Center". The Site is located at 2144 West Lake Shore Drive, Wilmington, North Carolina, and encompasses approximately 4 acres.

This ECP Report was prepared in conformance with primary Department of Defense and Army guidance, the Department of Defense's Base Redevelopment and Realignment Manual, DoD 4165.77-M (BRRM), Army regulations and the American Society for Testing and Materials (ASTM) Designation D 6008-96 (2005), *Standard Practice for Conducting Environmental Baseline Surveys*, as secondary guidance when it was not inconsistent with the primary guidance.

This ECP Report details the history of the property, including the U.S. Army Reserve and any prior tenant uses of the Site and the resulting environmental condition of the property.

The AFR Center facility is situated on approximately 4 acres of land with three permanent buildings: a 22,581 square-foot AFR Center building, a 3,696 square-foot Organizational Maintenance Shop (OMS), and a 3,500 square-foot storage building. The Site is currently occupied by two units: the 650th Transportation Company and the 993rd Transportation Company.

Based on a review of aerial photographs and U.S. Geological Survey (USGS) topographic maps dating back to 1958, the Site has served as an AFR Center since 1958. The AFR Center building and OMS were constructed in 1958.

Areas of environmental concern were reviewed and FMSM found petroleum impacts relating to the environmental condition of the property. Petroleum contamination from a former heating oil underground storage tank (UST) was remediated and a No Further Action (NFA) letter was issued by the North Carolina Department of Environment and Natural Resources (NCDENR).

In accordance with Department of Defense policy defining the classifications (See Deputy Under Secretary of Defense Goodman Memorandum dated 21 October 1996), the Property has been classified as Category 2. This classification does not include categorizing the property based on *de minimis* conditions that generally do not present material risk of harm to the public health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

1.0 INTRODUCTION

FMSM was contracted by the USACE – Louisville District, to prepare an ECP Report for the Adrian B. Rhodes AFR Center (NC045), in response to the Base Realignment and Closure (BRAC) 2005 legislation. The facility is located at 2144 West Lake Shore Drive, Wilmington, NC, hereafter referred to as the “Site” or “AFR Center”. In support of the ECP Report, a visual reconnaissance of the Site was conducted on 2 August 2006. The purpose of the visit was to visually obtain information indicating the environmental condition of property at the Site.

1.1 PURPOSE OF ENVIRONMENTAL CONDITION OF PROPERTY REPORT

The Military Department with real property accountability shall assess, determine and document the environmental condition of all transferable property in an ECP Report. This ECP Report is based on readily available information. Pursuant to the Department of Defense’s policy, set forth in the Base Redevelopment and Realignment Manual (DoD 4165.66-M, March 1, 2006) Section C8.3 (BRRM), the primary purposes of the ECP Report include the following:

- Provide the Army with information it may use to make disposal decisions;
- Provide the public with information relative to the environmental condition of the property;
- Assist in community planning for the reuse of Base Realignment and Closure (BRAC) property;
- Assist Federal agencies during the property screening process;
- Provide information for prospective buyers;
- Assist prospective new owners in meeting the requirements under EPA’s “All Appropriate Inquiry” regulations;
- Provide information about completed remedial and corrective actions at the property;
- Assist in determining appropriate responsibilities, asset valuation, and liabilities

The ECP Report contains the information required to comply with the provisions of 40 Code of Federal Regulations (CFR) Part 373, which require that a notice accompany contracts for the sale of, and deeds entered into, for the transfer of federal property on which any hazardous substance was stored, released or disposed of. The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA),

Section 120(h) stipulates that a notice is required if certain quantities of designated hazardous substances have been stored on the property for one year or more – specifically, quantities exceeding 1,000 kilograms or the reportable quantity, whichever is greater, of the substances specified in 40 CFR 302.4 or one kilogram of acutely hazardous waste as defined in 40 CFR 261.30. A notice is also required if hazardous substances have been disposed of or released on the property in an amount greater than or equal to the reportable quantity. Army Regulation (AR) 200-1 requires that the ECP Report address asbestos, lead-based paint, radon and other substances potentially hazardous to human health.

This ECP Report used the American Society for Testing and materials (ASTM) Designation D 6008-96 (2005), *Standard Practice for Conducting Environmental Baseline Surveys* as a guideline when not inconsistent with the BRRM, CERCLA § 120, Army regulations and other applicable Army guidance.

1.2 SCOPE OF SERVICES

This ECP report covers the AFR Center located at 2144 West Lake Shore Drive, Wilmington, North Carolina. The property is bound by West Lake Shore Drive to the east and Stadium Drive to the north. Site maps are provided in Appendix A. Appendix B provides photographs taken during the August 2006 site visit. Appendix C provides warranty deeds for the property and chain of title information. Historical environmental documents and reports are provided in Appendix D, while Appendix E contains the Environmental Data Resources, Inc. (EDR) reports.

This ECP report classifies the property into one of seven DoD Environmental ECP categories as defined by Deputy Under Secretary of Defense S. Goodman Memorandum, “Clarification of ‘Uncontaminated’ Environmental Condition of Property at BRAC Installations” (21 October 1996). The property classification categories are as follows:

- Category 1 – Areas where no release or disposal of hazardous substances or petroleum products has occurred (including no migration of these substances from adjacent areas).
- Category 2 – Areas where only the release or disposal of petroleum products has occurred.
- Category 3 – Areas where release, disposal, and/or migration of hazardous substances has occurred, but at concentrations that do not require a removal or remedial response.
- Category 4 – Areas where release, disposal, and/or migration of hazardous substances has occurred, and all removal or remedial actions to protect human health and the environment have been taken.

- Category 5 – Areas where release, disposal, and/or migration of hazardous substances has occurred, and removal or remedial actions are under way, but all required remedial actions have not yet been taken.
- Category 6 – Areas where release, disposal, and/or migration of hazardous substances has occurred, but required actions have not yet been implemented.
- Category 7 – Areas that are not evaluated or require additional evaluation.

2.0 SITE LOCATION AND PHYSICAL DESCRIPTION

2.1 SITE LOCATION

The AFR Center is located in the western portion of New Hanover County, North Carolina, within the city limits of Wilmington, North Carolina. The site is located in a primarily residential area, with residential areas to the north and a municipal property to the west and south. Greenfield Lake is located east of the Site. Figure 1 in Appendix A provides a general site location map.

2.2 ASSET INFORMATION

Facility Name and Address: Adrian B. Rhodes, Armed Forces Reserve Center
(NC045)
2144 West Lake Shore Drive
Wilmington, NC 28401

Property Owner: United States Government

Date of Ownership: 11 December 1957

Current Occupant: 650th and 993rd Transportation Companies

Zoning: R7 - Residential

County, State: New Hanover County, North Carolina

USGS Quadrangle(s): Wilmington, North Carolina

Parcel: Tract A-100, Parcel # R06013-018-008-000

Latitude/Longitude: 34.203900 N; 77.935600 W

Legal Description: Copies of the deeds, which include legal descriptions, are provided in Appendix C.

2.3 PHYSICAL DESCRIPTION

The AFR Center is situated on 4.26 acres with three permanent structures: a 22,581 square-foot AFR Center building, a 3,696 square-foot OMS building, and a 3,500 square-foot supply storage building. The unit storage building has a sheet metal exterior and is located in the northwest corner of the Site. The AFR Center building and OMS were constructed in 1958.

The AFR Center building consists of a two story structure with concrete block and brick veneer walls. Photograph 1 in Appendix B provides a front view (facing west) of the exterior of the building. Photograph 2 in Appendix B provides a view of the south end of the building facing north. The interior of the AFR Center building consists of office space, classrooms, kitchen area, storage, arms vaults, and an assembly hall. Photographs 3 through 13 provide interior views of the AFR Center building. Figures 3 and 4 in Appendix A provide layouts of the interior of the AFR Center building.

The OMS is a one-story, concrete block and brick veneer structure. The OMS contains two work bay areas, a storage room, mechanical/equipment rooms and offices. A separate office was added to the south end of the OMS at some time but historical documents do not indicate when this addition was constructed. Overhead metal retractable doors are located on the west wall of the building. Photograph 14 in Appendix B shows the front (west) view of the OMS. Photographs 15 - 18 in Appendix B show the interior of the OMS. Figure 5 in Appendix A provides a layout of the interior of the OMS.

The unit storage building consists of a one-story, rectangular-shaped structure with a concrete slab floor and metal walls and roof. The unit storage building consists of a caged storage area used mainly for field equipment. Photographs 21 and 22 show exterior and interior views of the unit storage building.

A military equipment parking (MEP) area and a privately owned vehicle (POV) parking area are also contained within the Site. The POV parking area is located to the south of the AFR Center building, and the OMS and MEP are situated to the north and northwest. Photographs 2 and 21 in Appendix B provide views of the POV and MEP areas, respectively. Chain-link security fencing topped with barbed wire encloses the MEP area, OMS, unit storage building, and the north section of the property. Approximately three-fourths of the Site is covered by impervious surface features (e.g. asphalt parking areas, driveways, concrete walkways, buildings, etc.). The remaining ground surface is covered by lawn area and a sparse population of deciduous trees. The southwest corner of the property contains dense vegetation and is heavily wooded. Topographically, the Site is flat and exhibits no obvious slope. Figure 2 in Appendix A provides a current plan view layout of the Site. Appendix B provides photographs taken during the August 2006 site visit.

Vehicle washing historically occurred in the wash rack located west of the OMS. A floor drain adjacent to the wash rack carried water to an in-ground OWS located between the wash rack and the OMS.

Approximately fifteen military vehicles, including heavy expanded mobility tactical trucks (HEMTT) and high mobility multipurpose wheeled vehicles (HMMWV or Humvee), were located within the MEP area during the site visit. Several non-permanent metal Container Express (CONEX) units were located in the MEP area and a portable

hazardous materials (HAZMAT) storage unit was located south of the OMS. See Photos 19 - 21 in Appendix B for views of the military vehicles and portable storage units.

2.4 SITE HYDROLOGY AND GEOLOGY

2.4.1 Surface Water Characteristics

Figure 6 in Appendix A provides a portion of the 1993 Wilmington, North Carolina United States Geological Survey (USGS) topographic map, which includes the Site. As shown, the Site is situated at an elevation of approximately 8 feet above mean sea level and is relatively flat.

The Site is situated adjacent to Greenfield Lake which lies to the east. A drainage ditch on the Site flows beneath West Lake Shore Drive and discharges into the lake. The outlet stream from Greenfield Lake eventually discharges into the Cape Fear River, which is located approximately one mile to the west. The Cape Fear River discharges into the Atlantic Ocean.

According to the Federal Emergency Management Agency (FEMA) digital Flood Hazard Area map indicates that the Site lies within the 100-year floodplain. Figure 7 in Appendix A provides a map depicting the 100-year and 500-year floodplain in relation to the Site.

2.4.2 Geology/Hydrogeological Characteristics

The site is situated on the Coastal Plains of North Carolina. The area is underlain by limestone of the Peedee Formation of Cretaceous age and limestone and dolomitic limestone of the Castle Hayne Formation. Significant layers of coastal sediments can be situated over the limestone and dolomitic limestone. Plates 8 and 9 in the 1995 Site Assessment Report indicated that the new surface sediments were composed of layers of poorly graded sand and silty sand. Groundwater was encountered from 7 to 8 feet below the surface and limestone bedrock was encountered approximately 30 feet below the surface.

Groundwater in the Wilmington area primarily occurs in two aquifers – the surficial coastal deposits, and the limestones and sands of the Castle Hayne Formation. The surficial aquifers are generally unconfined aquifers. The coastal sediments deposited on top of the confining bedrock, typically occur at a depth of 20 to 50 feet, and are not used for water supply in the Wilmington area. The Castle Hayne aquifer is the most productive aquifer in the State. It is usually a confined aquifer within the limestone, and is found at a depth of over 90 feet in the Wilmington area.

According to information from the GeoCheck section of the EDR report the specific type of soil at the Site is from the Kureb series. The soil does not meet the requirements of a hydric soil. However, the Kureb series can contain inclusions of Leon sand, which is a hydric soil. There is a potential for wetland features in areas of depression through the Kureb sand.

The surface soils are sandy. These soil types have high infiltration rates, low water holding characteristics, high hydraulic conductivity and are characterized as soils with coarse textures. The profile of the area shows sand from the surface down to a depth of 80 inches.

2.5 SITE UTILITIES

Water Service – The City of Wilmington provides potable water for the Site.

Sanitary Sewer System – The City of Wilmington Waste Water Department provides sewer service to the Site.

Gas & Electric – Piedmont Gas provides natural gas to the Site and Progress Energy provides electric service.

2.6 WATER SUPPLY WELLS & SEPTIC SYSTEMS

Based upon a review of available historical site and agency records and interviews with site personnel, no water supply wells or septic systems have been located at the Site.

A search of Federal and State water well databases identified four USGS monitoring wells located within one mile of the Site, with none of these four wells located within $\frac{1}{4}$ mile of the Site. The databases did not identify any water supply wells within one mile of the Site.

3.0 SITE HISTORY

3.1 HISTORY OF OWNERSHIP

Appendix C contains a chain of title report completed for the Site. The chain of title report did not identify any leases or environmental liens against the AFR Center property. According to historical documentation, the United States of America purchased the property from the City of Wilmington in 1957.

Available business directories including City, cross-reference, and telephone directories were reviewed, if available, at approximately five-year intervals for the years spanning 1964 through 2006. According to a City Directory provided by EDR and dated 10 July 2006, the address of the AFR Center was first listed in the research source in 1975. Subsequent city directory searches list the Site at 2144 West Lake Shore Drive from 1975 through 2005. A copy of the City Directory is included in Appendix E.

3.2 PAST USES AND OPERATIONS

In 1957, the U.S. Government purchased 4.26 acres for construction of the AFR Center. Construction of the AFR Center building and OMS occurred in 1958. Historical information sources do not indicate the uses of the parcel prior to the purchase by the U.S. Government. The Site has served as a reserve and mobilization center for the U.S. Army Reserve since the U.S. Government purchased the land.

The Site primarily functioned as an administrative, logistical, and educational facility, with limited maintenance of military vehicles and equipment occurring in the OMS building. The Site has been used by reservists for drill activities throughout its history. The facility is currently occupied by the US Army Reserve 650th and 993rd Transportation Companies. In addition US Navy Reserve and Coast Guard use the facility for training. At the time of the site visit, the AFR Center building contained various items, including desks, office furniture, and folding tables.

The OMS has been used to perform limited maintenance activities on military vehicles and equipment. Activities inside the OMS were reportedly limited to preventative maintenance checks, including checking vehicle fluids such as motor oil, water, and antifreeze, and light maintenance activities. Small amounts of cleaning supplies, solvents, paint and other materials were stored in a flammable materials cabinet in the OMS.

Vehicle washing has historically occurred in the wash rack located to the west of the OMS building. The wash rack drains to the OWS and reportedly discharges into the city sanitary sewer. An inspection report is included with the Sites historical documents, which indicates the OWS is functioning properly. Historical documents show that the OWS was serviced in 1997 and 2005.

Historical aerial photographs and topographic maps were a primary source of information on the past use and operations at the Site. Figure 6 and Figures 8 through 13 in Appendix A provide USGS topographical maps from 1970 and 1979 and aerial views of the Site and surrounding areas in 1958, 1983, 1993, and 2005. Greenfield Lake appears to the east of the Site in all historical maps and aerial photographs.

The 1958 aerial photograph (Figure 8, Appendix A) shows the AFR Center building and the OMS present on the Site without additions to the structures. North of the Site are residential buildings and south of the Site is undeveloped with wooded areas. The property west of the site contains a horse track and baseball field.

The 1970 USGS topographical map (Figure 9, Appendix A) shows the Site with two buildings present. The areas to the south and north appear undeveloped. Legion Stadium is noted west of the Site.

The 1979 USGS topographic map (Figure 10, Appendix A) shows the Site and surrounding properties as similar to those shown on the 1970 USGS topographic map.

The 1983 aerial photograph (Figure 11, Appendix A) shows the AFR Center building with its addition complete and the OMS building without any addition. The property to the west contains a baseball stadium and the property to the south is developed with one structure present. The property north of the Site appears similar to the 1958 aerial photograph.

The 1993 and 2005 aerial photographs (Figure 12, in Appendix A) show the Site and surrounding properties similar to the conditions observed during the August 2006 site reconnaissance.

3.3 PAST USE, STORAGE, DISPOSAL, AND RELEASE OF HAZARDOUS SUBSTANCES

3.3.1 Past Use and Storage of Hazardous Substances

Information related to the past use and storage of hazardous substances at the Site was compiled through review of available site records, search of Federal and State environmental databases, and interviews with Army Reserve personnel.

Chemicals formerly used and stored at the Site were associated with vehicle and facility maintenance activities, and janitorial services. Janitorial chemicals and building maintenance-related products were stored in the designated storage area within the janitorial closet located in the AFR Center building. Vehicle maintenance products and small amounts of petroleum, oil, and lubricant (POL) products were also stored within designated areas within the OMS building.

Certain types of chemical products used and stored at the Site would likely have contained CERCLA hazardous substances and would have been stored on a rotational basis in amounts necessary to support the unit through direct support level maintenance. There is no indication that CERCLA hazardous substances were stored at the Site for one year or more in excess of corresponding reportable quantities.

Used oil, used antifreeze, and POL have been stored in separate containers outside the OMS. Minor amounts (less than 30 gallons total) of cleaners, solvents and paints have been stored inside the HAZMAT unit. The used oil AST capacity is 275 gallons and the used antifreeze AST capacity is approximately 200 gallons. POL is stored in 1-gallon and 5-gallon containers with a total volume less than 100 gallons.

3.3.2 Past Disposal and Release of Hazardous Substances

Information related to past disposal and potential release of hazardous substances at the Site was compiled through review of available site records, search of Federal and State environmental databases, and interviews with Army Reserve personnel. According to Army Reserve personnel and site records, on-site disposal of hazardous materials or wastes has not occurred at the Site.

3.4 PAST PRESENCE OF BULK PETROLEUM STORAGE TANKS

Based upon a review of available site records, a search of Federal and State environmental databases, and interviews with Army Reserve personnel, a total of five USTs have been present at the Site.

A 550-gallon heating oil UST was installed for the OMS in the late 1950s. This tank was replaced by a 1,000-gallon heating oil UST in the 1970s. The 1,000 gallon UST for the OMS was removed in 1993 and no remediation was required.

A 2,000-gallon heating oil UST was installed at the north end of the AFR Center building in the late 1950s. This tank was abandoned in place and a 5,000 gallon heating oil UST was installed in the same location in the late 1970s. A 1,000-gallon heating oil UST was installed at the south end of the AFR Center building when a building addition was completed in the late 1970s. These three USTs were removed in 1993 and no remediation was required for the 1,000-gallon UST and the 5,000-gallon UST.

During the 1993 removal of USTs, a leak was observed in the 2,000 gallon UST. The subsequent site assessments indicated petroleum constituent concentrations in soil and groundwater were above North Carolina action levels. Approximately 500 cubic yards of soil was removed from the Site and the area was backfilled with clean soil. Groundwater monitoring continued after the soil remediation and showed decreasing concentrations of petroleum constituents. An NFA letter was issued by the NCDENR in 2001 indicating the release had been sufficiently remediated.

An OWS is present at the Site. Maintenance was performed on the OWS in 1997 and 2005, indicating that the OWS was functioning properly. Analysis of sludge samples showed that the waste material was non-hazardous and non-regulated waste.

3.5 REVIEW OF PREVIOUS ENVIRONMENTAL REPORTS

A review of site records produced several reports pertaining to the Site. The following subsections provide a brief summary of these reports. Copies of the reports, unless otherwise specified, are provided in Appendix D.

3.5.1 2005 Spill Prevention Control and Countermeasure Plan

The SPCC Plan was prepared by Environmental Enterprise Group in May 2005, to comply with 40 CFR 112, which provides the guidance for development of a plan to prevent and handle hazardous and petroleum releases. The plan includes a general listing of material and petroleum products stored at the Site, actions to be taken in the event of spills or releases, and key personnel who implement the plan.

3.5.2 1995 Site Assessment

A site assessment report was prepared for the Site in 1995. The assessment was conducted to determine the effects of a release from a former heating oil UST. The assessment noted the contamination was limited to the groundwater and soil at the north end of the AFR Center building and the presence of free product was the primary environmental concern. Results from laboratory testing are included with the attached copy of the report. A summary of the UST removal and remediation is included in Section 3.4.

3.5.3 2004 Lead-based Paint Survey Report

A lead-based paint (LBP) survey was completed in March 2004 by Environmental Enterprise Group. The survey was conducted for the AFR Center building and the OMS. LBP was found in the AFR Center building on interior and exterior doors and casings, exterior painted lintels, structural steel components and exterior metal fixtures. The OMS contained LBP in coatings on the exterior door, overhead doors, frames, lintels and structural steel components.

3.5.4 2002 Asbestos Re-inspection Report

A 2002 asbestos survey confirmed that ACM was present in the AFR Center building and the OMS. The survey reports that friable ACM was identified in pipe insulation located in the OMS. The friable ACM was removed and replaced with fiberglass insulation in 2002. Floor tiles which contain non-friable asbestos are present in both the administration building and OMS and were noted to be in good condition.

3.5.5 1995 Oil Water Separator Survey

A survey of the OWS at the Site was performed in 1995. The report indicated that the OWS had accumulated a significant amount of oil and solids. Overall, the OWS was reported to function properly. It is recommended in the report that the OWS be pumped out and cleaned.

3.5.6 1997 Oil Water Separator Cleaning Report

Earth Tech Inc. cleaned the OWS in March 1997. The report indicates the OWS was in good condition and that after cleaning, the OWS functioned freely with no blockages. Testing of sludge from the OWS showed that the sludge was a non-hazardous, non-regulated waste.

3.5.7 1993 UST Survey Report, 1993 UST Closure Report, 2003 UST Memorandum

- The 1993 UST Survey Report documented that there were four active heating oil USTs at the Site in August 1993.
- The 1993 UST Closure Report documented the removal of one 1,000-gallon heating oil UST that was located near the intersection of Stadium Drive and West Lake Shore Drive and served the OMS building. The report indicated that there was no evidence of a release from this UST.
- The 2003 UST Memorandum included this summary for the Site: Records indicate two 1,000-gallon heating oil USTs, one 2,000-gallon heating oil UST and one 5,000-gallon heating oil UST were removed FY93 by Environmental Technology of North America, Inc. The Closure Report indicated contamination had resulted from a leak in the 2,000-gallon UST tank. Remediation was completed and a Soil Cleanup Report dated 30 September 2000 was submitted to the NCDENR requesting a finding of NFA. The NCDENR issued a finding of NFA as documented in a letter dated 6 April 2001. Additional information is presented in Section 3.4.

3.5.8 1996 Underground Storage Tank Corrective Action Plan (CAP)

The CAP details the procedures for the remediation of soil and groundwater at the Site from the leaking UST removed in 1993. Only the 2,000-gallon heating oil UST that had been located near the north end of the AFR Center building had a release of petroleum. Monitoring wells were installed and additional groundwater and soil samples were taken. The report includes site maps of the well locations and diagrams of the monitoring wells.

3.5.9 2000 Soil Cleanup Report, 2001 Soil Cleanup Report NFA Correspondence

The 2000 Soil Cleanup Report documents the remedial activities performed at the Site for the residual contamination remaining from the former UST. Twelve monitoring wells were installed and sampling determined free product was present in one well and the groundwater plume extended 120 feet across the Site, but did not leave the AFR Center property. Nineteen soil borings were drilled and sampling determined that the soil contamination was limited to a depth of 4-6 feet below the ground surface immediately above the water table surface. The majority of the petroleum contaminated soil excavated was located at a depth of 4-7 feet below the ground surface. Approximately 300 cubic yards of clean soil was excavated from the surface and stockpiled, and over 500 cubic yards of contaminated soil were excavated and removed from the Site. Confirmation soil sampling was conducted by USACE personnel and indicated no constituents of concern were detected on the Site. Groundwater monitoring continued after the soil remediation and showed decreasing concentrations of petroleum constituents. NFA status was requested based on these results.

The May and June 2001 correspondence documents the communication between the 81st RSC, the City of Wilmington and the NCDENR for completing requirements for the No Further Action status at the Site.

3.5.10 Additional Site Work and Documents Provided

Additional environmental work was conducted at the Site and additional historical reports provided to FMSM after the date of the site visit. These reports are included in Appendix D.

Soil Sampling Report, November 2006. Soil samples were collected in the vicinity of the OWS in November 2006. The soil samples were analyzed for total petroleum hydrocarbons and the results were all below the laboratory detection limit of approximately 30 mg/kg.

NC Facilities Radon Results Datasheets, 1989-1990. Datasheets for radon testing at South Carolina USAR facilities were provided. A 90-day radon survey was conducted at the Site from December 1989 to March 1990. The radon results were at or below 1.0 pCi/l for all areas sampled at the Site. The USEPA recommended exposure limit for radon is 4.0 pCi/l. These datasheets are not included in Appendix D because the majority of the data are for other sites.

OWS Servicing, August 2005. The OWS was pumped out and the waste water and solids, classified as non-hazardous, were shipped off site for disposal. This report is not included in Appendix D because the majority of the report is disposal data and manifests for the water removed from the OWS.

4.0 ADJACENT PROPERTIES

Figure 13 in Appendix A provides a recent aerial view of the Site and adjacent properties. Table 1 provides a list of adjacent properties with their directional location in regards to the Site. A description of the zoning for the adjacent parcels is also listed in Table 1. Photographs 23 through 28 in Appendix B provide views of adjacent properties and surrounding land use.

TABLE 1 LIST OF ADJACENT PROPERTIES			
Direction From Site	Name/Type of Property	Address	Zoning
North	Residential	Stadium Drive	R-7 Residential
South	Wilmington Fire Department Training Tower	West Lake Shore Drive	GB – General Business
East	Greenfield Lake	West Lake Shore Drive	R-5 - Residential
West	Baseball Stadium	2221 Carolina Beach Road	GB – General Business

Appendix A and Appendix E provide historical aerial photographs, topographic maps, and EDR Reports, which were used to evaluate potential environmental impacts on adjacent properties that may have the potential to impact the environmental condition at the Site. The general land use of the surrounding properties does not indicate a concern regarding environmental impacts to the AFR Center.

5.0 REVIEW OF REGULATORY INFORMATION

A component of the ECP is the review of reasonably obtainable Federal, State, and local government records for the Site and surrounding properties, where there has been a release or likely release of a hazardous substance or petroleum product, and which is likely to cause or contribute to a release or threatened release of hazardous substance or petroleum product on the Federal real property. A regulatory database summary was acquired from EDR on 7 July 2006. The regulatory database summary consolidates standard Federal, State, local, and tribal environmental record sources based on ASTM recommended minimum search distances from the Site. A copy of the complete EDR report is included in Appendix E.

5.1 FEDERAL ENVIRONMENTAL RECORDS

The regulatory information presented in Table 2 was obtained from the EDR Federal regulatory database search report.

TABLE 2 FEDERAL DATABASE SEARCH								
Database	Search Distance (miles)	Site	<1/8	1/8 – 1/4	1/4 – 1/2	1/2 – 1	1	Total Plotted

5.1.1 Federal RCRA Small and Large Quantity Generators List Within 1/4 Mile

Conditionally exempt small quantity generators are defined as facilities generating less than 100 kilograms (kg) of hazardous waste, or less than 1 kg of acutely hazardous waste per month. RCRA small quantity generators are defined as facilities generating between 100 kg and 1,000 kg of hazardous waste per month, while a large quantity generator is defined as a facility generating more than 1,000 kg of hazardous waste, or over 1 kg of acutely hazardous waste per month.

The AFR Center is listed in the EDR report as a conditionally exempt RCRA-registered small quantity generator (SQG), with USEPA ID NC0210021929. The Site has no transport, storage and disposal (TSD) activities listed and no previous violations are reported. No documentation was available for RCRA-SQG activities or inventories at the Site.

No other RCRA-registered large or small quantity generators were identified near the Site.

5.1.2 CERCLIS List

The CERCLIS Database is the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) and contains information on hazardous waste sites, potentially hazardous waste sites and remedial activities across the nation.

The Site is listed on the CERCLIS database and is reported as having undergone a CERCLIS preliminary assessment which was completed on 13 September 2005. The Site was subsequently placed on the CERCLIS No Further Remedial Action Planned list.

5.1.3 Facility Index System/Facility Registry System (FINDS) Site

The FINDS List contains both facility information and “pointers” to other sources that contain more detail. The EDR report includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statute), and PADS (PCB Activity Data System).

According to the EDR report, the AFR Center is on the FINDS list due to being listed as a conditionally exempt RCRA SQG. The FINDS list is a cross-reference for RCRA info, a program that allows RCRA program staff to track the notification, permit, compliance and corrective action activities required under RCRA.

5.2 STATE AND LOCAL ENVIRONMENTAL RECORDS

The regulatory information presented in Table 3 was obtained from the EDR State regulatory database search report. Requests for State environmental records were submitted to the North Carolina Division of Air Quality, Water Quality, and Division of

Waste Management. No additional records were received from the State agencies. Copies of these letters are included in Appendix E.

**TABLE 3
 STATE DATABASE SEARCH**

Database	Search Distance (miles)	Site	<1/8	1/8 – 1/4	1/4 – 1/2	1/2 – 1	1	Total Plotted
State Haz. Waste	1.000	X	0	0	0	0	NR	1
NC HSDS	1.000		0	0	0	1	NR	1

NPDES	TP		NR	NR	NR	NR	NR	NR

TP = Target Property; NR = Not Required

5.2.1 State Hazardous Waste Sites Within 1 Mile

The State hazardous waste site records are the States' equivalent to CERCLIS. These sites may or may not already be listed on the Federal CERCLIS list. Priority sites planned for remediation using State funds are identified along with sites where remediation will be paid for by potentially responsible parties.

The EDR report lists the Site as a State Hazardous Waste Site, which is a cross-reference for the RCRA SQG list for North Carolina. The Site is listed as a site requiring no further action.

5.2.2 Incident Management Database Within 1/2 Mile

The Incident Management Database (IMD) contains sites which have groundwater or soil contamination resulting from spills or releases. The Site is listed on the IMD and

three other sites within 1/2 mile are listed on the database. Fast Fare #730, NC Army National Guard Armory, and Fast Fare #723 are located more than 1/4 mile west of the Site and are not believed to be a significant environmental risk.

The AFRC is listed on the IMD for being a LUST site which resulted in groundwater contamination. The IMD incident was closed out on 6 April 2001. The IMD report indicates a heating oil tank is the contaminant source.

5.2.3 State-Registered Leaking UST (LUST) Sites Within 1/2 Mile

According to the EDR report four LUST sites were identified within 1/2 mile of the AFR Center. Table 4 lists the four sites along with their addresses and elevations relative to the Site. The Site is also listed on the LUST database.

TABLE 4 LEAKING UNDERGROUND STORAGE TANK SITES				
Company/Site	Address	Distance and Direction from Site	Status	Elevation Relation to Site
Fast Fare #730	2158 Carolina Beach Road	1/2 - 1/4 mile WSW	Closed Out	Higher
NC Army National Guard Armory	2221 Carolina Beach Road	1/2 - 1/4 mile SW	Closed Out	Higher
Fast Fare #723	2069 Carolina Beach Road	1/2 - 1/4 mile W	Closed Out	Higher
Harry AMOCO	2305 Carolina Beach Road	1/2 - 1/4 mile SSW	Tanks Removed	Higher

No active LUST sites are located within 1/2 mile of the Site, and these sites are not believed to be a significant environmental risk.

The Site is listed as a LUST site due to a leaking heating oil underground storage tank which was removed from the Site in 1993. A no further action status was granted to the Site on 6 April 2001.

5.3 TRIBAL ENVIRONMENTAL RECORDS

The regulatory information presented in Table 5 was obtained from the EDR regulatory database search report.

TABLE 5 TRIBAL DATABASE SEARCH							
Database	Search Distance (miles)	<1/8	1/8 – 1/4	1/4 – 1/2	1/2 – 1	1	Total Plotted
Indian Reservation	1.000	0	0	0	0	NR	0
Indian LUST	0.500	0	0	0	NR	NR	0
Indian UST	0.250	0	0	NR	NR	NR	0

NR = Not Required

The database search did not identify any sites within the designated search radius requiring discussion.

5.3.1 Registered Indian Reservations Within 1 Mile

According to the EDR report, no designated Indian Reservations are located within one mile of the AFR Center.

5.4 EDR PROPRIETARY RECORDS

The regulatory information presented in Table 6 was obtained from the EDR's Proprietary Records database search report. Sites identified by this database search are discussed in the following subsections.

TABLE 6 EDR PROPRIETARY RECORDS DATABASE SEARCH							
Database	Search Distance (miles)	<1/8	1/8 – 1/4	1/4 – 1/2	1/2 – 1	1	Total Plotted
Manufactured Gas Plants	1.000	0	0	0	0	NR	0

NR = Not Required

The database search did not identify any sites within the designated search radius requiring discussion.

5.5 UNMAPPED SITES

The EDR database search listed eleven unmapped sites. Unmapped sites are facilities with insufficient address information to enable them to be located and mapped, and they

can only be identified as within the zip code of the Site. None of the unmapped sites were not observed within 1/4 mile of the AFR Center during the reconnaissance drive of the site vicinity and are not believed to be a significant environmental risk.

5.6 SUMMARY OF PROPERTIES EVALUATED TO DETERMINE RISK TO THE SITE

Based on an evaluation of available site information and details concerning the properties listed in the database searches, none of the facilities evaluated are classified as "High Risk". "High Risk" properties are those that exhibit significant environmental conditions that have the probability of adversely affecting the environmental conditions at another site.

6.0 SITE VISIT AND REVIEW OF ENVIRONMENTAL PROPERTY CONDITIONS

Findings documented in the following subsections are based on the 2 August 2006 site visit and area reconnaissance, a review of available site records, and information obtained from U.S. Army Reserve personnel.

6.1 UNDERGROUND/ABOVEGROUND STORAGE TANKS

No USTs were observed at the Site. Four heating oil USTs were removed from the Site in 1993. The site assessments and remediation that followed the removal of the USTs are summarized in Sections 3.4 and 3.5. Two ASTs, one for used oil (275 gallons) and one for used antifreeze (200 gallons), are present on Site outside the OMS. The ASTs were observed to be in good condition.

One in-ground OWS, located west of the OMS, was observed during the August 2006 site visit. Based on historical documents and interviews with reserve personnel, the OWS was serviced in 1997 and 2005 and has no known releases.

6.2 INVENTORY OF CHEMICALS / HAZARDOUS SUBSTANCES

At the time of the site visit, the OMS contained two flammable materials cabinets that contained various paints, lubricants and solvents in containers with volumes of one gallon or less. A POL locker located outside the OMS was reported to be empty, but was locked and its contents were not observed. A portable HAZMAT storage unit is located south of the OMS, but the unit was locked and its contents were not observed. No chemicals or hazardous materials were observed in the storage building in the northwest corner of the property. The AFR Center building had small amounts of cleaning supplies, solvents and paint which were stored in various metal cabinets. The medical and dental exam office (Photos 7 and 8 in Appendix B) did not contain any hazardous substances.

6.3 WASTE DISPOSAL SITES

There were no signs of landfilling or illegal waste disposal activities at the Site during the August 2006 site visit.

6.4 PITS, SUMPS, AND DRYWELLS

The restrooms and kitchen in the AFR Center building contained floor drains. All floor drains in the AFR Center building are connected to the municipal sanitary sewer system.

The vehicle wash rack located west of the OMS has one floor drain connected to an OWS located between the wash rack and the OMS. Site personnel confirmed that the wash rack discharges to the municipal sanitary sewer.

No pits, sumps or drywells were observed during the site reconnaissance.

6.5 ASBESTOS CONTAINING MATERIAL

A 2002 asbestos inspection confirmed that ACM is located in the AFR Center building and the OMS. The survey reports that the only friable material was pipe insulation located in the OMS. The friable ACM was removed and replaced with fiberglass insulation in 2002. Floor tiles, which may contain asbestos, were observed to be in good condition in both the AFR Center building and OMS.

6.6 POLYCHLORINATED BIPHENYL CONTAINING EQUIPMENT

Two pole-mounted transformers were observed on the Site property near the north end of the AFR Center building. Visual observation of the transformers from the ground indicated they are in good condition with no leaks observed. The transformers were not labeled for PCB content. Maintenance and remediation of the transformers would be the responsibility of the utility owner, Progress Energy. No response has been received to date for an information request concerning the transformers.

6.7 LEAD-BASED PAINT

All painted surfaces observed during the site reconnaissance appeared to be in good conditions with no peeling or flaking. A lead-based paint (LBP) survey was completed in March 2004 by Environmental Enterprise Group. The survey was performed on the AFR Center building and the OMS building. LBP was found in the AFR Center building on interior and exterior doors and casings, door and window lintels, interior wood window stools, baseboards, chalkboards and structural steel components. In addition LBP was found in the OMS on window casings, exterior doors and frames, window and door lintels and yellow painted structures.

6.8 RADON

Site-specific radon surveys were conducted in 1989-1990 for the AFR Center. The radon results were at or below 1.0 pCi/l for all areas sampled at the Site. The USEPA recommended exposure limit is 4.0 pCi/l.

6.9 MUNITIONS AND EXPLOSIVES OF CONCERN

No evidence of munitions and explosives of concern, including unexploded ordnance, were found during the site visit.

6.10 RADIOLOGICAL MATERIALS

During the August 2006 site visit and records review process, no indications were found of the current or past use, storage or disposal of radiological commodities at the AFR Center.

7.0 REVIEW OF SPECIAL RESOURCES

7.1 LAND USE

Figure 13 in Appendix A provides a 2005 satellite imagery view of the AFR Center and surrounding properties and depicts current land use. According to the City of Wilmington Zoning browser, the Site is currently zoned R-7 Residential and is located in a residential area. Greenfield Lake is located to the east of the Site.

7.2 COASTAL ZONE MANAGEMENT

The Division of Coastal Management (DCM), within the Department of Environment and Natural Resources, is the lead agency for the North Carolina Coastal Area Management Act (CAMA). According to the DCM webpage, New Hanover County is one of 20 counties covered by CAMA. Based on its location away from the ocean, navigable waters or estuary shoreline, the AFR Center is not located in an area of environmental concern that would require a CAMA permit.

7.3 WETLANDS

The U.S. Fish and Wildlife Service (USFWS) National Wetland Inventory (NWI) map shows that wetlands are identified on the Site. The mapped wetland is located on the southwest portion of the site, between the POV parking area and the west property line. In addition, soils at the Site are classified as Kureb sand, which is not hydric soil, but can contain inclusions of Leon sand, which is a hydric soil. There is a potential for wetland formation in areas of depression through the Kureb sand. Based on a review of the NWI map and soils information, it appears that jurisdictional wetlands occur in the wooded southwest portion of the Site. Figure 14 in Appendix A provides an NWI map illustrating wetlands at the southwest end of the Site.

7.4 100-YEAR FLOODPLAIN

A review of the Federal Emergency Management Agency digital Flood Hazard Area map indicates that the Site lies inside the 100-year floodplain. This floodplain is associated with Greenfield Lake, and extends from the western shore of the lake to approximately the west property line of the Site. Figure 7 in Appendix A shows the most recently updated Flood Insurance Rate Map (FIRM) of the Site location.

7.5 NATURAL RESOURCES

According to the United States Fish and Wildlife Service (USFWS), the threatened and endangered species shown in Table 7 are known to occur in New Hanover County, NC. No determination concerning the occurrences of these species or their potential habitat is rendered here.

TABLE 7 FEDERALLY THREATENED AND ENDANGERED SPECIES TO KNOWN TO OCCUR IN NEW HANOVER COUNTY, NC		
Common Name	Scientific Name	Federal Status
Shortnose sturgeon	<i>Acipenser brevirostrum</i>	Endangered
Red-cockaded woodpecker	<i>Picoides borealis</i>	Endangered
West Indian manatee	<i>Trichechus manatus</i>	Endangered
Cooley's meadowrue	<i>Thalictrum cooleyi</i>	Endangered
Rough-leaved loosestrife	<i>Lysimachia asperulaefolia</i>	Endangered
Seabeach amaranth	<i>Amaranthus pumilus</i>	Threatened
Loggerhead sea turtle	<i>Caretta caretta</i>	Threatened
Green sea turtle	<i>Chelonia mydas</i>	Threatened
Piping plover	<i>Charadrius melodus</i>	Threatened

7.6 CULTURAL RESOURCES

The Site does not appear on the National Register of Historic Places (NRHP). Because the Site is younger than 50 years, it is most likely not eligible for listing in the NRHP. A 2005 architectural survey report concluded that the NC045 facility did not meet any of the criteria for exceptional significance and the report recommended the buildings were not eligible for the National Register of Historic Places.

7.7 OTHER SPECIAL RESOURCES

A review of other special resources was conducted including a search for various federally managed and protected lands within or near the Site. The Site is not within an Officially Designated Wilderness Area according to wilderness.net. It is not within a National Wetlands Management District according to the USFWS. The National Park Service (NPS) does not include the Site on the Wild and Scenic Rivers and Trails lists.

8.0 CONCLUSIONS

FMSM was contracted by the USACE, Louisville District Engineering Division to prepare an ECP report for the Adrian B. Rhodes AFR Center, located at 2144 West Lake Shore Drive, New Hanover County, North Carolina. The Site is currently in use by the 650th and 993rd Transportation Companies. The Site has primarily functioned as an administrative, logistic, and educational facility, with limited vehicle maintenance occurring in the OMS building.

Findings of this ECP report are based on existing environmental information, including visual observations, site records, Federal, State, and local database and file information, related to the storage, release, treatment, or disposal of hazardous substances or petroleum products or derivatives on the property. The following paragraphs present the findings related to the environmental conditions on the property that were evaluated during the ECP report process.

- **Asbestos** - A 2002 asbestos re-inspection report confirmed that ACM is located in the AFR Center building and the OMS building. The survey reports that reportedly friable ACM was present as pipe insulation located in the OMS building. The friable ACM was removed and replaced with fiberglass insulation in 2002. Floor tiles, which are assumed ACM, are present in both the AFR Center building and OMS and were observed to be in good condition. The asbestos report indicated the remaining ACM was managed under an O&M Plan; however, this plan was not available for review.
- **Lead-Based Paint (LBP)** - LBP was found in the AFR Center building on interior and exterior doors and casings, exterior painted lintels, structural steel components and exterior metal fixtures. The OMS building contained LBP on the exterior door, overhead doors, frames, lintels and structural steel components.
- **Munitions and Explosives of Concern** - No evidence of munitions and explosives of concern, including unexploded ordnance, were found during the site visit.
- **PCB Transformers** - Two pole-mounted transformers are located on the Site near the north end of the AFR Center building. Visual observation of the transformers from the ground indicated they are in good condition with no leaks observed. The transformers were not labeled for PCB content. Maintenance and remediation of the transformers would be the responsibility of the utility owner, Progress Energy. No response has been received to date for an information request concerning the transformers.
- **Radiological Materials** - No radiological materials were identified at the time of the August 2006 site visit. There is no evidence to suggest that any radiological

commodities were ever improperly managed at the Site, or that any radionuclides were ever released.

- **Radon** – Site-specific radon testing showed average radon levels at the Site were at or below 1.0 pCi/l. The USEPA recommended radon exposure limit is 4.0 pCi/l.
- **Special Resources** - Based on a review of the NWI map and soils information, mapped wetlands are located in the wooded southwest portion of the Site.
- **Surrounding Properties** - Potential environmental sites of concern, located within corresponding ASTM search radius distances from the Site, were evaluated. None of the properties evaluated are considered high risk. “High Risk” properties are those that exhibit environmental conditions that have the probability of adversely affecting the environmental conditions at another site.
- **Use & Storage of CERCLA Hazardous Substances** - Chemicals containing CERCLA hazardous substances would likely have been used and stored at the Site in amounts necessary to support unit-level vehicle and building maintenance activities. However, the quantities stored would not have exceeded corresponding CERCLA threshold planning quantities. There is no evidence that the chemicals used or stored were ever improperly handled, released, or disposed at the Site. Therefore, it is not believed that the past use and storage of hazardous substances have negatively impacted environmental conditions at the Site.
- **USTs/ASTs** - Four USTs were removed from the Site and a no further action letter has been issued by the NCDENR. A used oil AST and a used antifreeze AST are located outside the OMS.
- **Wash Water Discharge** - A vehicle wash facility has been in use at the Site. Residual oil from the vehicle wash rack was collected by the underground OWS located west of the OMS. The OWS discharges to the municipal sanitary sewer system. Historical reports and interviews indicated the OWS has been serviced regularly and functions properly.

In accordance with Department of Defense policy defining the classifications (See Deputy Under Secretary of Defense Goodman Memorandum dated 21 October 1996), the Site has been classified as Category 2, an area where only the release or disposal of petroleum products has occurred. This classification is based on the remediation of contaminated soil associated with a former heating oil UST.

9.0 LIMITATIONS

This ECP Report was prepared to review certain elements of the environmental condition of property related to the storage, release, treatment, or disposal of hazardous substances or petroleum products. It documents efforts to determine or discover the presence or likely presence of a release or threatened release of these materials. Project activities were performed in general conformance with ASTM D6008, consistent with the BRRM, the project prescribed scope of work, and generally accepted practices in the consulting industry. The degree of care and skill is consistent with that generally exercised in the industry under similar conditions.

FMSM has relied on certain information provided by the USACE, USAR, and other parties referenced in the report. This information was assumed to be accurate and complete unless information to the contrary arose during the course of the ECP process. Historic documentation (e.g., information on past environmental practices, environmental records, AFRC operational changes, unit and equipment changes, chemical/substance inventories and storage, current as-built drawings, etc.) and facility personnel knowledge regarding chemicals used or stored on the Site and the quantities stored, was often limited or non-existent. Therefore, statements regarding storage of chemicals or presence of hazardous substances reflect best available data and are not warranted for either completeness or accuracy over the history of the facility.

In preparing this report, FMSM was required to review previous documents from other sources (collectively referred to herein as the Prior Reports). The Prior Reports may present findings regarding the abatement or remediation of known concerns at the time of their preparation or within the limit of the project scope of work. The Prior Reports may include statements or opinions of the original authors of the Prior Reports as to the satisfactory completion of work. FMSM notes that environmental laws and regulations, including abatement or remedial action levels, are periodically reviewed and updated by the various regulatory agencies and may have changed since the respective dates of the Prior Reports.

FMSM has summarized Prior Reports in fulfilling the prescribed scope of work for the project. This summarization may include statements or opinions as to the satisfactory completion of work. These statements or opinions are those of the original report authors. FMSM neither warrants nor certifies the accuracy or completeness of these statements. The summarization of previous documents has not reviewed or updated those conclusions with regards to actions from the time of that document to date, current regulatory agency abatement, or remedial standards. Rather, this summary provides the original author's conclusions at the time the report was prepared. Evaluation of the completeness of previous documents or statements of abatement or remediation is beyond the current scope of service included in this contract.

A limited site reconnaissance was performed to visually identify materials or conditions representing recognized adverse environmental conditions. Identification of hidden conditions, observation of the effects of activities or incidents occurring after completion of the reconnaissance, buried conditions, conditions obscured by dense foliage, conditions beneath buildings, other structures, or covered by building/paving materials, or conditions otherwise obscured, is beyond the scope of this work. The conditions described in this report are valid only for the time that the observations were made. Some conditions may change with time.

The findings and conclusions contained in this report are based in part on the information available at the time of the study. The findings and conclusions should be considered not as scientific certainties, but as probabilities based on professional judgment of the significance of the limited data gathered in the course of the site evaluation, interviews and literature review. If additional or corrected information becomes available, FMSM requests the opportunity to review/modify conclusions, as warranted.

STATE OF NORTH CAROLINA
COUNTY OF NEW HAMOVER

DEED

THIS INDENTURE made and entered into this 11th day of December 1957, between CITY OF WILMINGTON, a municipal corporation duly organized and existing under and by virtue of the laws of the State of North Carolina, hereinafter called the party of the first part, and the UNITED STATES OF AMERICA, hereinafter called the party of the second part; W I T N E S S E T H :

That the party of the first part for and in consideration of the sum of ONE AND NO/100 (\$1.00) DOLLAR to it in cash in hand paid by the party of the second part at or before the sealing and delivery of these presents, the receipt and sufficiency of which is hereby acknowledged, has granted, bargained, sold and conveyed and, by these presents, do grant, bargain, sell and convey unto the party of the second part and its assigns, the following described real estate, to-wit;

All that tract or parcel of land lying and being situate in New Hanover County, North Carolina, in the City of Wilmington, and lying between the race track and Greenfield Lake, bound on the North by a dirt road, which road is adjacent to and south of Woodlawn Subdivision; on the East by Lake Shore Drive; on the South by a ditch; and on the West by a series of lines approximately 50 feet easterly from the race track, and being more particularly described as follows:

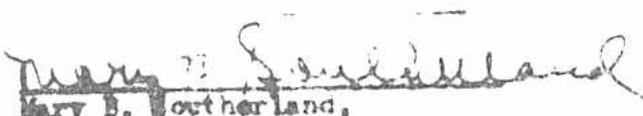

Beginning at a point on the West right-of-way line of Lake Shore Drive, which point is located S 02° 26' W, 55.65 feet from the southeast corner of Lot No. 26 of the Woodlawn Subdivision; thence along a series of lines approximately 30 feet westerly from the center line of Lake Shore Drive S 06° 36' E, 97.70 feet; thence S 16° 09' E, 50 feet; thence S 21° 43' E, 100 feet; thence S 01° 50' E, 50 feet; thence S 07° 48' W, 80 feet; thence S 08° 23' W, 331 feet; thence S 11° 02' W, 114.5 feet; thence, leaving Lake Shore Drive, and along a line on the north side of a ditch S 80° 15' W, 233.58 feet to a point approximately 50 feet east of the easterly side of the race track; thence along a series of lines approximately 50 feet easterly from the easterly side of the race track N 17° 51' E, 277 feet; thence N 10° 21' E, 100 feet; thence N 06° 39' W, 100 feet; thence N 25° 39' W, 100 feet; thence N 43° 39' W, 100 feet; thence N 62° 09' W, 100 feet; thence N 66° 59' W, 38 feet to a point on the south side of a road, which road lies adjacent to and immediately south of the Woodlawn Subdivision (Plat of Woodlawn Subdivision recorded in Plat Book 4, Page 15, of the New Hanover County Records); thence along the south side of the last aforementioned road; N 67° 40' E, 424 feet to the point of beginning, and containing 4.26 acres, more or less.

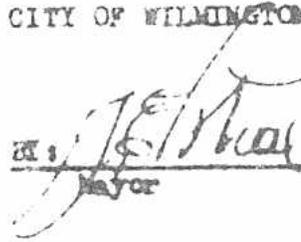

TO HAVE AND TO HOLD the said described property together with all and singular the rights, members, hereditaments and appurtenances to the same belonging or in anywise appertaining, to the only proper use, benefit and behoof of the said party of the second part and its assigns in FEE SIMPLE forever.

IN TESTIMONY WHEREOF, the parties of the first part have hereunto set their hands and seals on the day and year first above written.

ATTEST:

CITY OF WILMINGTON:

Mary B. Southerland,
City Clerk

J. E. L. Wade
Mayor

STATE OF NORTH CAROLINA !
COUNTY OF NEW HANOVER !

I, Evelyn L. Farrell, a Notary Public in and for the State and County aforesaid, do hereby certify that personally came before me Mary B. Southerland, who being duly sworn, says that she knows the common seal of the City of Wilmington, and is acquainted with J. E. L. Wade, who is Mayor of the City of Wilmington and that she the said Mary B. Southerland is Clerk of said City and saw the said Mayor of the City of Wilmington sign the foregoing instrument and saw the said seal of said City affixed to said instrument by said Mayor and that she the said Mary B. Southerland, Clerk as aforesaid, signed her name in attestation of the execution of the said instrument in the presence of said Mayor of said City.

Witness my hand and official seal this 18th day of December, 1957.

Evelyn L. Farrell
Notary Public

My Commission Expires May 31, 1958.

1.0 HISTORICAL OVERVIEW

1.1 Spill Prevention Control and Countermeasure Plan (SPCCP)

Federal regulation 40 CFR 112 provides the guidelines for the development of the SPCCP in regards to oil. The SPCCP establishes procedures, methods and equipment to prevent the discharge of oil from non-transportation related facilities into surface waters. The Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) regulations 40 CFR 300.33, RCRA regulation 40 CFR 264.52, and Army regulation AR-200-1 expand the scope of the SPCCP to incorporate hazardous substances as defined in 40 CFR 302.3.

An SPCCP must be prepared for a facility when one of the following criteria are met:

1. A reasonable potential for discharging oil from fixed facilities into waters of the United States exists.
2. The oil storage capacity on site exceeds either:
 - a. 42,000 gallons of underground storage.
 - b. 1,320 gallons of total above ground storage, or any single container having a capacity in excess of 660 gallons.
3. A toxic storage facility is present or there is sufficient storage of a hazardous substance.

In general, the following information will be included as part of the requirements for the SPCCP:

1. Information about the facility including, but not limited to, name, type or function, location and address, overall drainage patterns and location maps.
2. Name and title of the designated person responsible for coordinating responses to oil and hazardous substance spills.
3. An inventory list of storage, handling and transfer facilities that could possibly produce a significant spill. Included will be a prediction of the direction of the flow and total quantity.
4. An inventory of all oil and hazardous substances at storage, handling and transfer facilities.
5. A detailed description of equipment and countermeasures including structures and equipment for diversion and containment of spills.
6. A description of deficiencies at each listed site along with recommendations to correct any deficiencies.

Owners or operators of a facility for which an SPCCP is required shall maintain a complete copy of the plan at the facility if it is normally attended at least 8 hours per day.

The SPCCP shall be amended in accordance with 40 CFR 112.7 whenever there is a change in facility design, construction, operation or maintenance that materially affects the facility's potential for the discharge of oil into or upon waters of the United States of America. Such amendments shall be implemented within six months after any changes occur. The SPCCP shall be updated every three years as a minimum.

1.2 Installation Spill Contingency Plan (ISCP)

The National Contingency Plan was established under the Clean Water Act and CERCLA 40 CFR 300.33 which state that all Federal Agencies must plan for emergencies and develop procedures for dealing with oil discharges and releases of hazardous substances for which they are responsible.

An ISCP establishes responsibilities, duties, procedures and resources to be employed to contain, mitigate and clean up oil and hazardous substance spills and provides assistance to other outside agencies when required. The ISCP must be implemented whenever one of the following conditions occur:

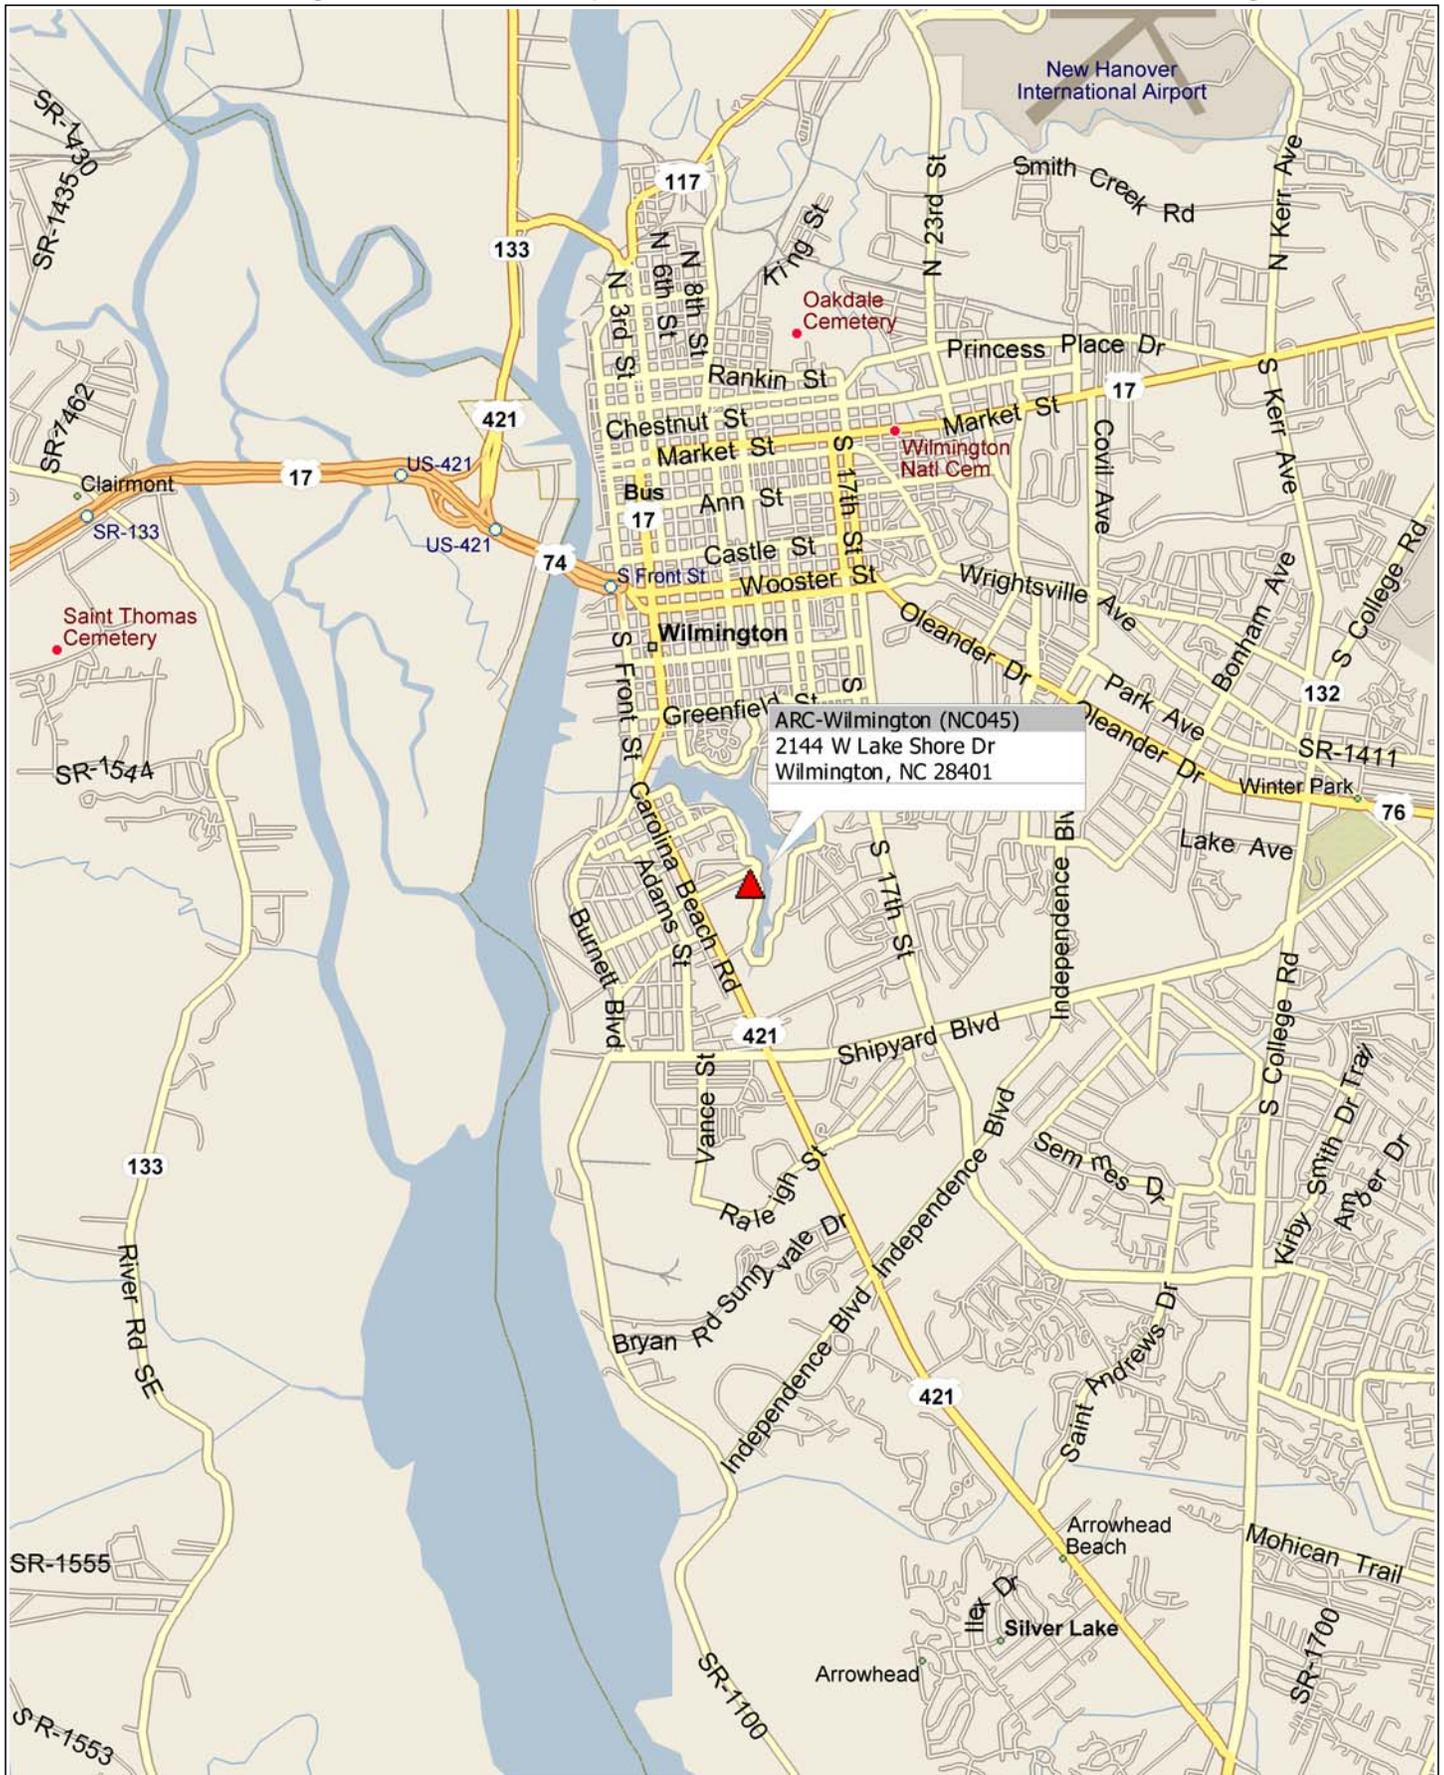

1. A reportable quantity is released.
2. An oil spill has reached or has the potential to reach waters of the United States of America.
3. There is any doubt to the seriousness of a hazardous materials incident.

In general, the following information will be included as part of the requirements for the ISCP:

1. Provisions specifying the responsibilities, duties, procedures and resources to be used to contain and clean up spills.
2. A description of immediate response actions that should be taken when a spill is first discovered.
3. Names, responsibilities and duties of the Facility Response Team.
4. Procedures for the Facility Response Team to follow for alert and mobilization.
5. A current list of persons and alternates to contact in the event of a spill.
6. Surveillance procedures for early detection of spills.
7. Identification of specific actions to take in the event of a spill.
8. Procedures for reporting a spill.
9. A description of safety precautions for known hazardous substances.
10. Recommendations for public affairs.

ARC-Wilmington Location Map

Fig. 1-0

2.0 FACILITY OVERVIEW

2.1 Name and Location

Adrian Rhodes US Armed Forces Reserve Center (NC045)
2144 W. Lakeshore Drive
Wilmington, NC 28401-7247

2.2 Date of Initial Operation

The facility was constructed in 1959 and has received several renovations. Renovations to the facility include a building wing addition, a wash rack facility and oil/water separator.

2.3 Operation and Activities

The facility is home to several reserve units including the 521st Transportation Detachment and the 650th and 993rd Transportation Companies and includes an OMS and a HAZMAT Storage Locker. The operations performed at the OMS include minor general vehicle maintenance and storage of small amounts of petroleum oil lubricants and hazardous materials (i.e., antifreeze, paint products, etc.). Major repairs to equipment are conducted at the ECS at Ft. Bragg. Materials are stored in the shop, the HAZMAT Storage Locker, the used oil storage tank, used antifreeze tank and waste drums stored in a Secondary Containment Unit (SCU).

2.4 Geographical/Topographical Description

The facility is located in the west-central section of New Hanover County, east of US Highway 421 on W. Lakeshore Drive adjacent to Greenfield Lake. The facility site generally drains south and southwest to an unnamed drainage ditch on the west side of the property that routes the flow to Greenfield Lake on the east side of Lakeshore Drive.

Figure 1-0 shows the site location of the facility.

3.0 POTENTIAL SPILL SOURCES

The Motorpool Sergeant / Facility Manager will attach the most current product inventory to Appendix E of this plan when it is received. It is understood that products and quantities could vary on a daily basis. Figure 3-1 shows a schematic layout of potential spill areas along with direction of flow paths. Figure 3-2 shows the shop layout.

3.1 Operations Maintenance Shop (OMS)

Small amounts of petroleum, oils, lubricants, gasoline, grease, transmission fluid, brake fluid, and antifreeze are regularly used in the two (2) bay shop. Two flammable storage cabinets and a parts washing vat are located in the shop where most material is stored. Materials could possibly spill during routine maintenance of the vehicles. The outside parking area has an asphalt surface that provides additional protection in the event of a spill leaving the shop. Spill supplies are not readily available in the shop. An inventory of the products in the shop is shown in Appendix E.

3.2 HAZMAT Storage Locker

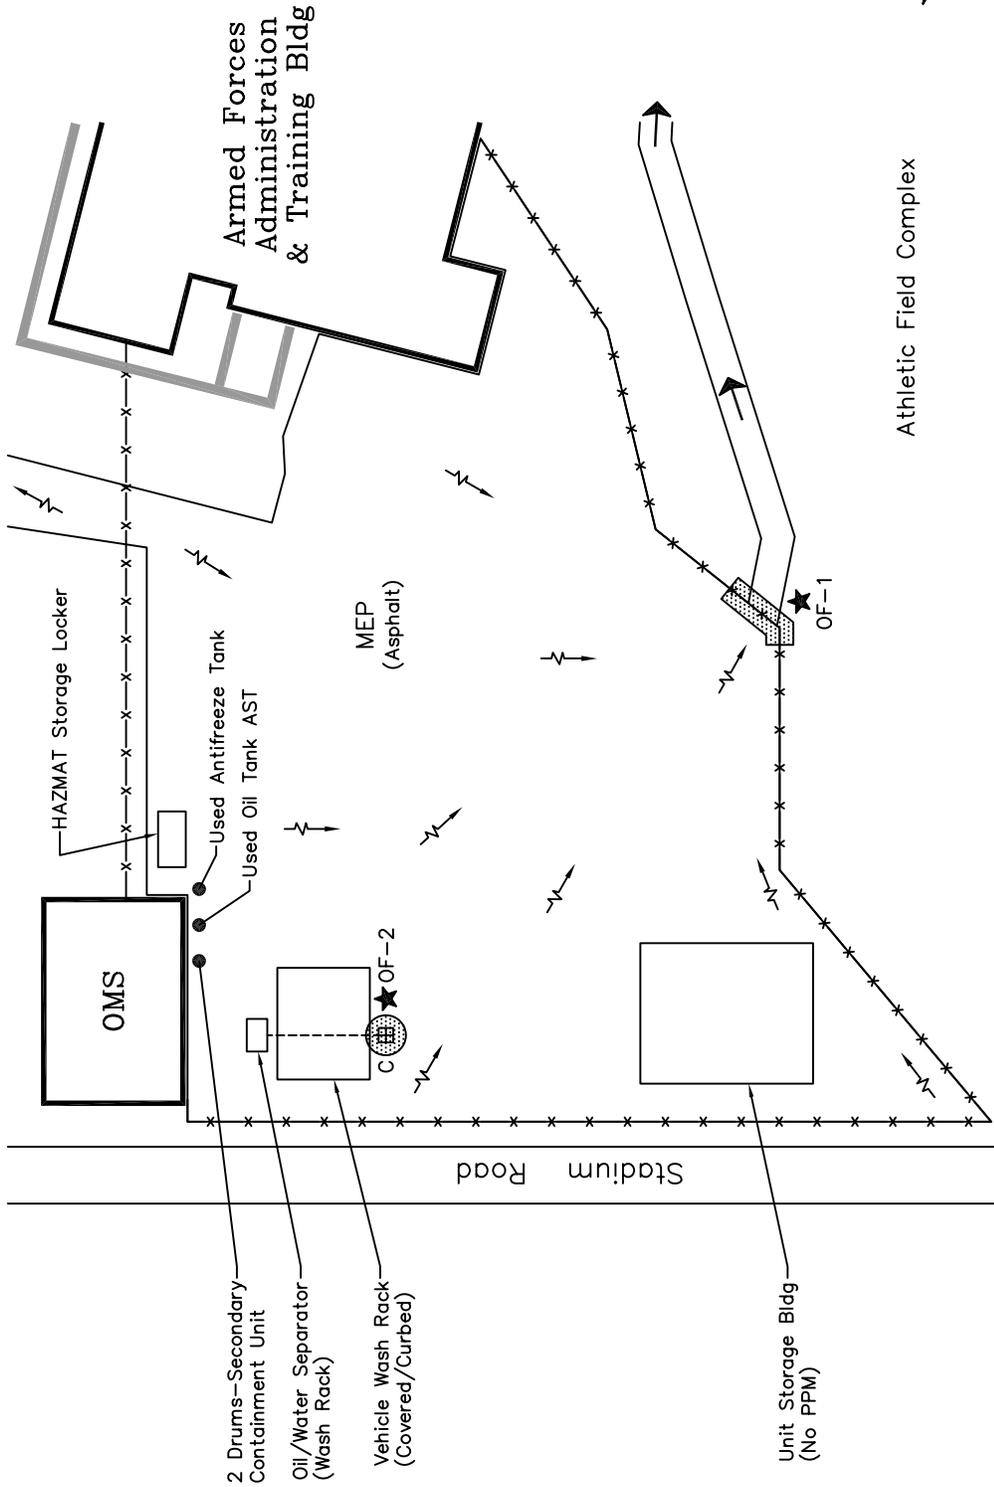

The HAZMAT Storage Locker is located south of the OMS and has a containment compartment located below the open grate floor to collect potential spills. The locker provides adequate spill protection but spill supplies are not readily available. Inventory for materials stored in this area are found in Appendix E.

3.3 Used Oil Storage Tank/Used Antifreeze Tank/SCU

The Used Oil Tank and a Used Antifreeze Tank are sitting on wood pallets just outside the bay doors of the OMS. Next to them is a plastic Secondary Containment Unit (SCU) containing two 55-gallon drums of unknown waste that is awaiting disposal. The tank fill connections were closed during the site visit, but the tanks are exposed to all types of weather, which can be severe at times. Spill supplies were not readily available in the area.

3.4 Military Equipment Parking (MEP)

The Military Equipment Parking area is used to store various size military vehicles. Spills could occur from leaks on these vehicles. Spills would be small in nature (< 5 gallons) although a larger leak could occur if a vehicular system failed completely. Vehicle drip pans/pads were not in use and spill response supplies were not readily available for use. The area is asphalt, which will provide some protection in the event of a spill. The vehicle wash rack is located in the MEP, just east of the shop and has an oil/water separator that discharges into the sanitary sewer system.

SCALE	NONE	DWG NUMBER	OMS_FLOOR_PLAN_WILMINGTON_NC	SHEET		1	OF 1

4.0 FACILITY DEFICIENCIES

Spill response supplies were not readily available in the shop. There is no trench drain system and large spills could migrate out into the parking area and into a nearby storm drain but the small quantity of material located in the shop would make that unlikely.

4.1 OMS

Although there is not a large amount of PPM in the shop, insufficient spill supplies are located in the shop. Corrective measures will be discussed in Section 5 of this plan.

4.2 HAZMAT Storage Locker

It appears the containment compartment located below the open grate floor for collection and storage of potential spills is designed properly but very little spill response supplies were readily available. Corrective measures will be discussed in Section 5 of this plan.

4.3 Used Oil storage Tank/Used Antifreeze Tank/SCU

The used oil and used antifreeze tanks are sitting on the ground adjacent to the shop and are exposed to the weather. Although the oil tank is double-lined, there is no secondary containment for these tanks in case of a large leak or spill. Spill response supplies were not readily available in the area of the tanks. Corrective actions will be discussed in Section 5.

4.4 Military Equipment Parking Area

The asphalt parking area does provide limited protection in the event of a spill or vehicle POL leak. Vehicle drip pans/pads were not in use and spill response supplies were not readily available for use. Countermeasure improvements will be discussed in Section 5 of this plan.

4.5 Spill Record Statement

At the time of the site visit, the facility had no record of any spills occurring within the past twelve months. It will be the responsibility of the Facility Environmental Action Coordinator to document any spills and attach the documentation to this plan on an annual basis. A sample spill report form is attached in Appendix D.

5.0 RECOMMENDED CORRECTIVE AND PREVENTIVE MEASURES

5.1 OMS

The spill response supplies (emergency spill control kits) listed in Table 5-1 should be the minimum quantities required to be on hand at all times in the shop. This will provide additional spill supplies for the shop, the used oil and antifreeze tanks and the washrack areas. At time of site visit, adequate quantities were not available.

Table 5-1 Spill Control Items for Shop

Item	Unit	Size	Quantity
Absorbent Pads	Bundle	100	1
Absorbent Booms	Bundle	5 feet	3
Oil Absorbent	Bag	44 liters	2
Non-sparking Shovel	Each	-	1
Polyurethane Squeegee	Each	-	1
Overpack Drum	Each	30 gallons min.	1

In the event of a spill, if necessary, personnel should immediately use the spill control equipment to further contain a potential spill. **All emergency spill equipment should be readily obtainable and not be located in a secured area (i.e., locked cage or locked room).**

5.2 HAZMAT Locker/ Used Oil Storage Tank/Used Antifreeze Tank/SCU

Spill response supplies (weather-proof spill control kits) with the quantities listed in Table 5-2 below need to be staged near the HAZMAT Locker area. This will provide spill supplies for the HAZMAT Locker, the used oil tank, used antifreeze tank, the SCU and the east side of the MEP.

5.3 Used Oil Storage Tank/Used Antifreeze Tank

The tanks are sitting on pallets on the ground in the MEP in front of the shop. These tanks should be under cover and preferably on a bermed, covered platform to provide secondary containment in case of spill. A curbed and covered shed or additional HAZMAT-type locker needs to be provided as soon as feasible to provide the desired protection.

5.4 Military Equipment Parking

Drip pads/pans need to be utilized in the MEP when leaks and drips from vehicles are possible. The actions listed in Paragraph 5.2 above will provide adequate spill supplies for east end of the MEP but the spill response materials (weather-proof spill control kit) listed in Table 5-2 needs to be staged near the Unit Storage Building to provide spill response supplies for the west end of the MEP and Outfall OF-1.

Table 5-2 Spill Control Items for HAZMAT Locker/Used Oil Tank/Used Antifreeze Tank/SCU/MEP

Item	Unit	Size	Quantity
Absorbent Pads	Bundle	100	1
Absorbent Booms	Bundle	10 feet	2
Oil Absorbent	Bag	44 liters	2
Overpack Drum	Each	30 gallons min.	1

5.5 Collection of Used Petroleum Oil Lubricants

Recommended procedures for the collection of used petroleum oil lubricants should be implemented as follows:

1. All services performed on unit vehicles and equipment should be conducted to ensure that used oil is prevented from being spilled. In the event of a spill, all sanitary and storm sewer systems should be protected so that the spill is prevented from entering and contaminating the sewer systems. When possible, servicing should be accomplished inside the shop bays where spill equipment is readily available and the shop floor offers some protection. The spill should be immediately collected for proper disposal.
2. Collect used oil in approved containers after vehicle services are performed. The used oil should be disposed of in the appropriate double-walled tank marked "used oil" by trained shop personnel as soon as possible.
3. All containers used for oil collection should be clearly marked and properly stored in a contained area to prevent potential residues/spills from migrating to a larger area.
4. Once the Used Oil Tank is filled to 75% capacity, the motor pool sergeant, shop foreman or responsible person should contact the 81st RRC environmental section for proper disposal.

6.0 PROCEDURES TO IMPLEMENT PLAN IN EVENT OF SPILL

The purpose of this chapter is to outline procedures to implement in the event of a spill. It includes responsibilities of key personnel, procedures for normal duty hours, provisions for off-duty office hours, planning measures prior to all exercises, outside agencies contact phone numbers, public relations information, and communications.

6.1 Responsibilities of Key Personnel

Unit Commanders - Unit Commanders at all levels should ensure that the provisions of this plan are properly implemented. They should ensure that Environmental Action Coordinators are appointed on orders and that all unit personnel are briefed on the procedures of this plan. In the event of a spill requiring resources beyond those of the unit, unit Commanders should arrange for appropriate assistance from other units located at the facility, the unit's higher headquarters, and the 81st RRC Environmental Action Coordinator.

Facility Manager - The Facility Manager is responsible for coordinating the implementation of this plan. This includes monitoring potential sources of spill, performing facility clean-up operations that their local organizations can safely and adequately handle. The Facility Manager must identify and locate spill equipment and other resources that are available for the prevention, containment and clean up of spills.

Unit Environmental Action Coordinator - The unit Environmental Action Coordinator should coordinate with the Facility Manager, higher headquarters and the 81st RRC Environmental Action Coordinator in identifying and monitoring potential spill hazards and maintaining Material Safety Data Sheets, as required. The unit Environmental Action Coordinator should coordinate with higher headquarters to identify and locate required clean-up equipment and other resources and maintains continuous liaison with subordinate units and other units within the command regarding spill contingency efforts and related environmental issues. Appendix B – Emergency and Spill Response Action List includes points of contact for each unit. The appointed unit Environmental Action Coordinator should be responsible for updating the list (Appendix B) as personnel changes occur within the unit. The updated form should be submitted to the 81st RRC Environmental Action Coordinator.

81st Regional Readiness Command Environmental Action Coordinator - The 81st RRC Environmental Action Coordinator should work with the Facility Manager to properly implement this plan. He should assist the Facility Manager in identifying, monitoring and eliminating potential spill hazards. In the event of a spill, it will be the responsibility of the 81st RRC Environmental Action Coordinator to contact the appropriate outside agencies as listed in Appendix B – Emergency and Spill Response Action List.

Facility Spill Prevention Control and Countermeasures Point of Contact - The Facility Spill Prevention Control and Countermeasures Point of Contact should ensure that this plan is maintained and is current with applicable regulatory guidelines.

Facility Environmental Action Coordinator - The Facility Environmental Action Coordinator should work with Facility Manager in order to implement this plan. The Facility Environmental Action Coordinator should ensure that the facility is maintained and operated properly to prevent potential spills and that corrective measures are implemented expeditiously in the event of a spill.

6.2 Implementation of the SPCC Plan

The plan must be implemented should one or more of the following criteria occur:

1. Petroleum/Oil/Lubricant (POL) spill enters a sanitary or storm sewer system.
2. POL spill which causes a sheen on waters of the United States of America.
3. POL spill greater than 25 gallons.
4. POL spill less than or equal to 25 gallons not cleaned up within 24 hours will become a reportable spill.
5. Toxic/hazardous substance spill in any quantity.

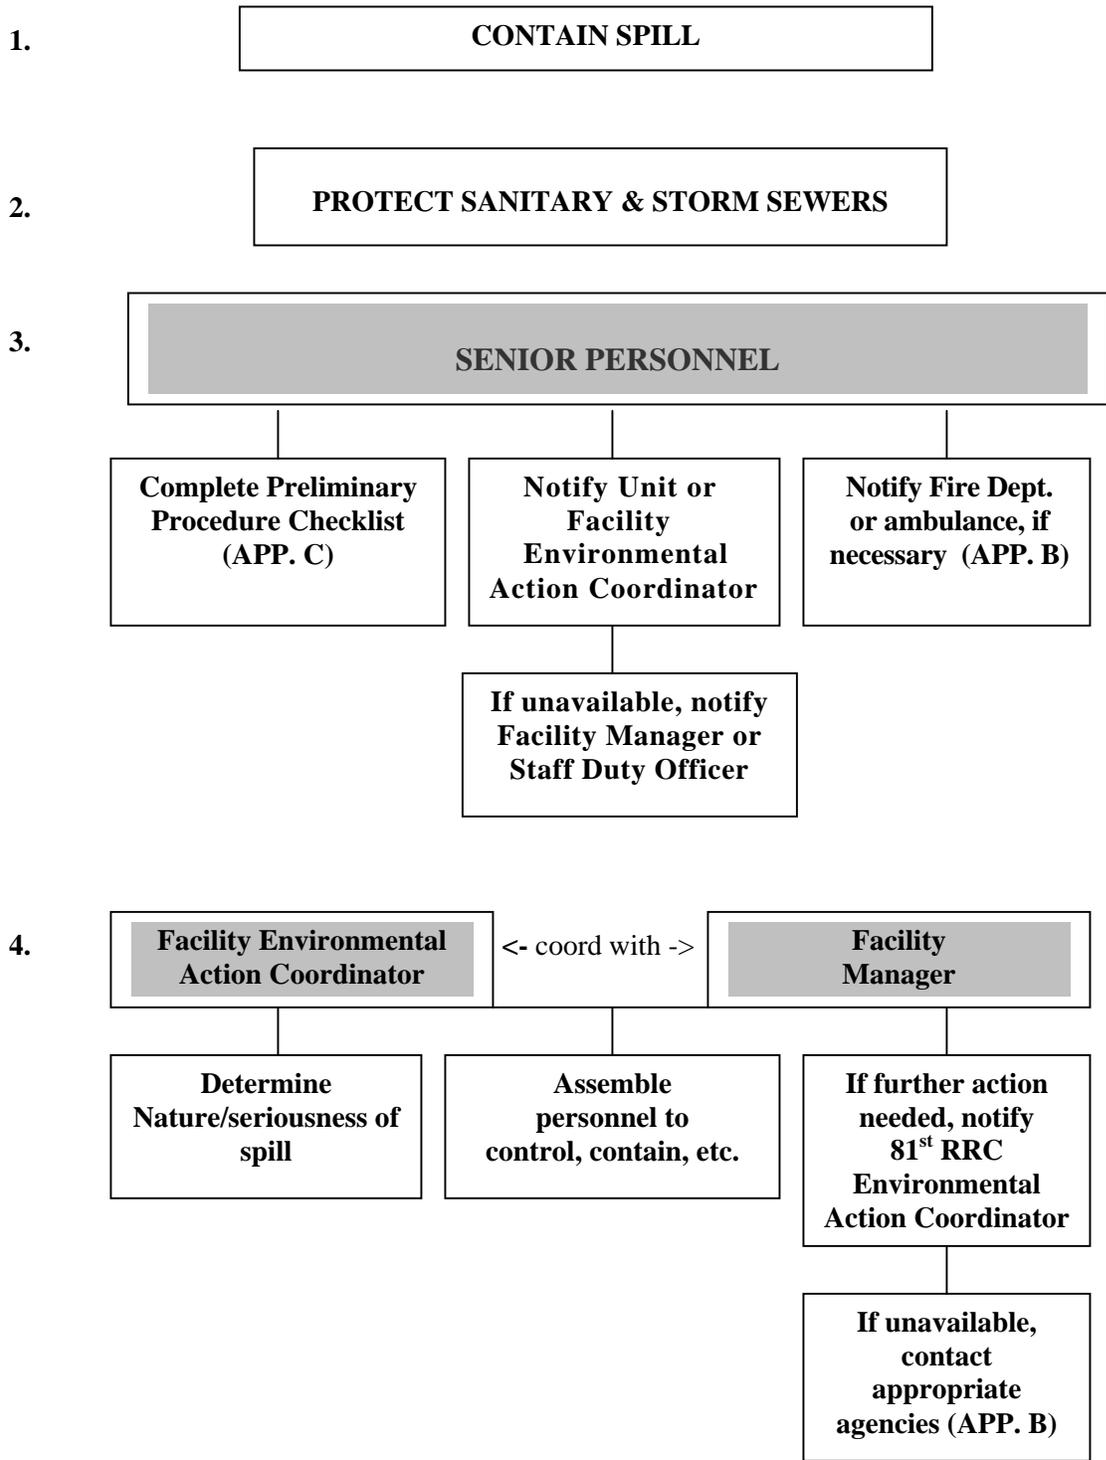

In the event of a spill, personnel at the location of the spill should take immediate measures to control and contain the spill and reduce fire and health hazards. Personnel safety will remain the first priority. Depending upon the nature of the spill and the hazardous or toxic materials involved, the senior person on the scene should ensure safety protection of personnel while undertaking containment measures.

6.3 SPCC Procedures for Normal Duty Office Hours (Mon. - Fri.; 7:30 a.m. - 4:00 p.m.)

In the event of a spill, the following procedures should be implemented (as shown in Figure 6-1):

1. Contain the spill as best possible with readily available means to prevent the spill from migrating to a larger area. Control devices such as spill control booms and absorbent material should be used. Personnel safety will remain first priority.
2. Assure that all sanitary and storm sewer systems are protected so that the spill is prevented from entering and contaminating the systems. As stated earlier, control devices such as spill control booms and absorbent material should be used.
3. Senior personnel in charge at the spill site should prepare the Preliminary Alert Procedure Checklist attached in Appendix C and immediately notify the Unit Environmental Action Coordinator and/or Facility Environmental Action Coordinator. The senior personnel should notify the Facility Manager and/or Staff Duty Officer in the event of the unavailability of either Environmental Action Coordinator. The senior person on the scene should immediately notify the fire department and/or ambulance service if it is necessary. Emergency telephone numbers are included in the Emergency and Spill Response Action List attached in Appendix B.
4. The Facility Environmental Action Coordinator should coordinate with the Facility Manager and determine the nature and seriousness of the spill. The Facility Environmental Action Coordinator should assemble a facility response team to further control, contain and take remedial action of the spill. Should outside agencies be required to be contacted to further control the spill, the Facility Environmental Action Coordinator and/or the Facility Manager should notify the 81st RRC Environmental Action Coordinator for further instructions. In the event of the unavailability of the 81st RRC Environmental Action Coordinator, the Facility Environmental Action Coordinator and/or Facility Manager should contact the appropriate outside agencies. Emergency telephone numbers are included in the Emergency and Spill Response Action List attached in Appendix B.

Figure 6-1 SPCCP Procedures for Normal Duty Office Hours

6.4 SPCC Procedures for Off-Duty Office Hours

In the event of a spill, the following procedures should be implemented (as shown in Figure 6-2):

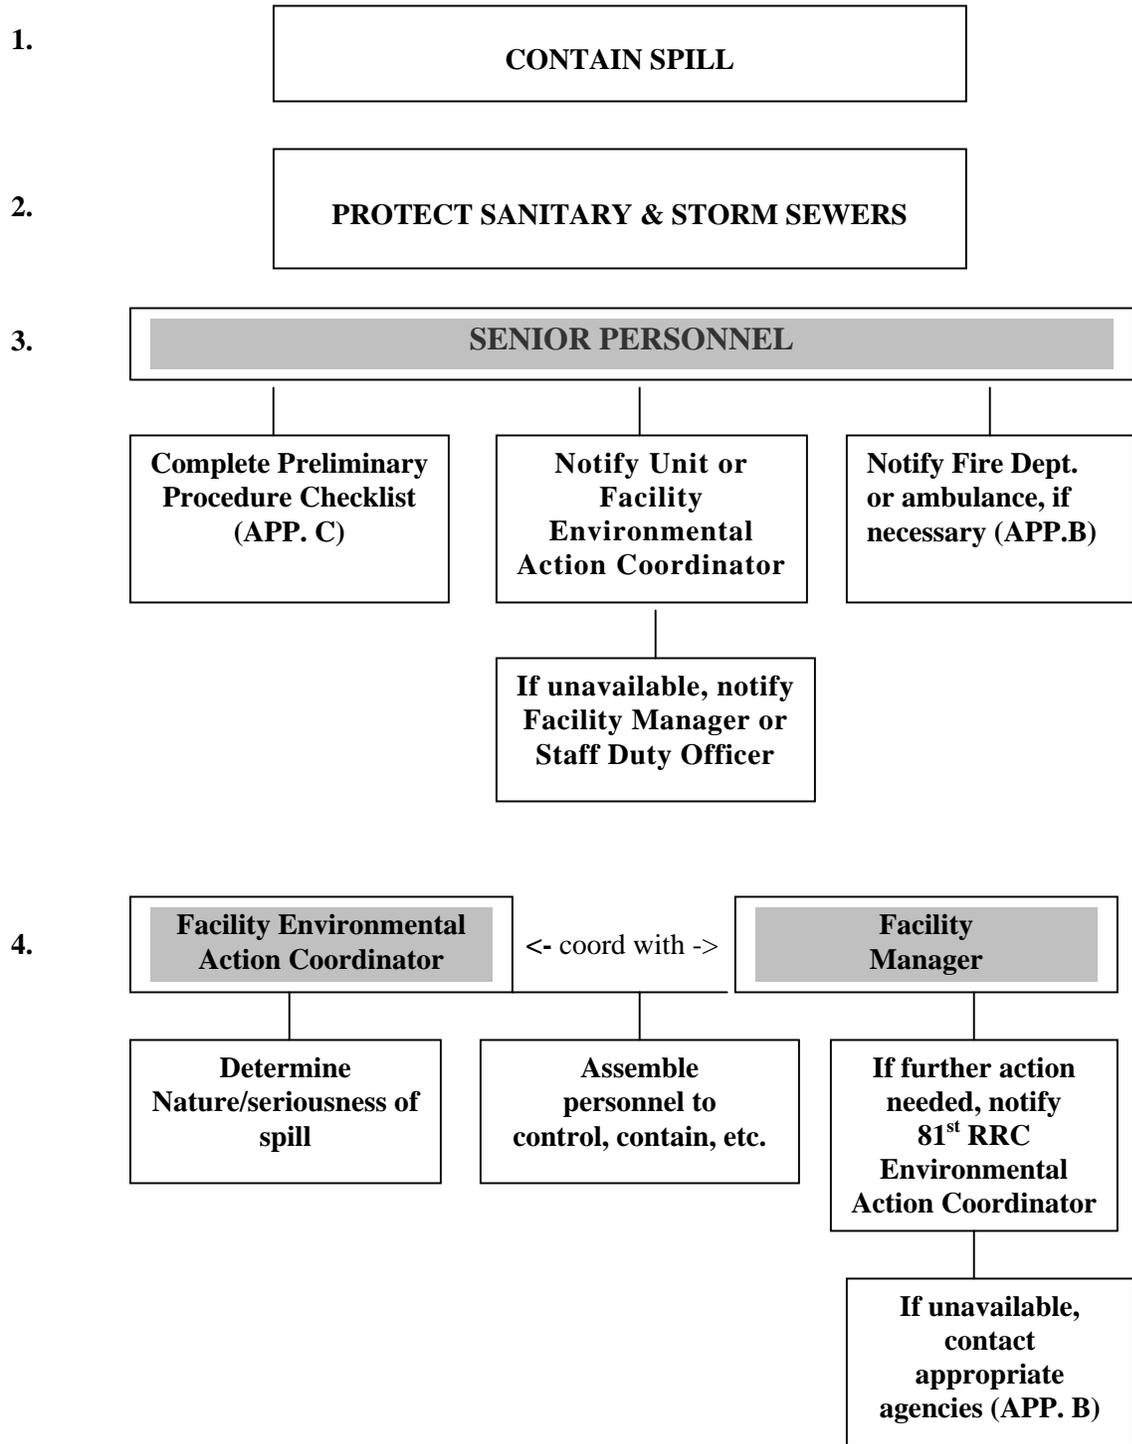

1. Contain the spill as best possible with readily available means to prevent the spill from migrating to a larger area. Control devices such as spill control booms and absorbent material should be used. Personnel safety will remain first priority.
2. Assure that all sanitary and storm sewer systems are protected so that the spill is prevented from entering and contaminating the systems. As stated earlier, control devices such as spill control booms and absorbent material should be used.
3. Senior personnel in charge at the spill site should prepare the Preliminary Alert Procedure Checklist attached in Appendix C and immediately notify the Unit Environmental Action Coordinator and/or Facility Environmental Action Coordinator. The senior personnel should notify the Facility Manager and/or Staff Duty Officer in the event of the unavailability of either Environmental Action Coordinator. The senior person on the scene should immediately notify the fire department and/or ambulance service if it is necessary. Emergency telephone numbers are included in the Emergency and Spill Response Action List attached in Appendix B.
4. The Unit or Facility Environmental Action Coordinator should coordinate with the Staff Duty Officer and determine the nature and seriousness of the spill. The Unit/Facility Environmental Action Coordinator should assemble personnel to further control, contain and take remedial action of the spill. Should outside agencies be required to be contacted to further control the spill, the Unit Environmental Action Coordinator and/or the Staff Duty Officer should notify the 81st RRC Environmental Action Coordinator for further instructions. In the event of the unavailability of the 81st RRC Environmental Action Coordinator, the Unit Environmental Action Coordinator and/or the Staff Duty Officer should contact the appropriate outside agencies. Emergency telephone numbers are included in the Emergency and Spill Response Action List attached in Appendix B.

6.5 Plan Prior to All Exercises

Prior to all exercises, the unit Commander and the Environmental Action Coordinator should determine a practical method for spill control in the field. Actions to be implemented should be as follows:

1. Identify the agency assigned responsibility for field clean up and the resource requirements for spill control. In the event of the unavailability of spill control equipment, requisition and obtain equipment prior to all exercises.
2. Prepare a list of names and telephone numbers of key personnel and the type and location of spill contingency equipment. This information should be annotated in the service support sections of all operations orders, Standard Operation Procedures and/or Letters of Instructions.
3. All personnel will be briefed on the scope of all exercises and the requirements of the spill contingency plan and the location(s) of spill contingency equipment. This briefing will include all individuals participating in the field exercise.

Figure 6-2 SPCCP Procedures for Off Duty Office Hours

6.6 Outside Agencies to Contact

The Environmental Action Coordinator, Facility Manager and/or Staff Duty Officer in coordination with the next higher headquarters and/or 81st RRC Environmental Action Coordinator, will determine additional personnel to be notified. The senior person on-site will base the need for outside agency notification on the size of the spill, severity of health hazard, potential for environmental damage and available spill containment resources. Appropriate outside agencies to contact include the following:

C. Outside Emergency Agencies

- | | |
|----------------------|----------|
| 1. Fire Department | Dial 911 |
| 2. Police Department | Dial 911 |
| 3. Ambulance | Dial 911 |

It will be the responsibility of the 81st RRC Environmental Action Coordinator to contact the following agencies if required:

1. EPA National Response Center, NRC
1-800-424-8802
2. U.S. Army Environmental Center
1-410-436-4714/1265
3. North Carolina Department of Environment & Natural Resources (NCDENR)
1601 Mail Service Center
Raleigh, NC 27699-1601
1-919-733-4984
4. North Carolina Emergency Operations Center
1-800-858-0368
5. Chemical Transportation Emergency Center, CHEMTREC
1-800-424-9300

6.7 Public Relations

Should a spill occur at the facility, the following procedures for public relations should be implemented:

1. Immediately following a spill, the ranking unit officer at the scene should contact his commander.
2. As soon as possible after a spill, a single unit Public Relations officer should be designated in conjunction with the next higher headquarters.
3. Detailed statements issued regarding a major spill should be cleared by the Staff Judge Advocate of the major headquarters.

4. No statements should be made containing any of the following, unless cleared by higher headquarters:
- a. Speculation concerning liability for the spill or its legal consequences.
 - b. Speculation regarding the cause of the spill.
 - c. Estimates of damages expressed in dollars.
 - d. Estimates of how long cleanup will take or of cleanup costs.
 - e. Promises that environmental quality or anything else will be restored to previous conditions.
 - f. Opinions concerning the appropriateness of government response to the spill.

6.8 Establishment of a Communications Center

Immediately following the notification process and assembly for contingency responsibilities, it is recommended to establish a communications center as follows:

1. Establish direct communications to the spill site.
2. Establish central location to assemble and brief additional personnel for clean up and/or containment operations.
3. Locate an area away from spill containment work where briefings to press, local government, and/or military personnel can be issued.
4. The Unit Commander or Environmental Action Coordinator should coordinate these activities with personnel or request augmentation as required.

7.0 RECOMMENDED TRAINING REVIEW REQUIREMENTS

Federal and Army regulations require annual training for individuals working with petroleum, oils, lubricants, and other hazardous materials. Newly appointed individuals must receive appropriate training concerning the spill potential of these materials and the hazards associated with performing their duties. This plan should be reviewed by all personnel annually and can be combined with other mandatory hazardous communication or spill response training events. It will be the responsibility of the 81st Regional Readiness Command to provide periodic training updates to each unit.

It is recommended to conduct a simulated “mock” spill event and implement the procedures in the SPCCP as if a spill actually occurred. A “mock” spill event should be simulated once a year during normal duty hours and once a year during off-duty hours for each unit.

8.0 APPROVAL AND CERTIFICATION

Professional Engineer Certification

I hereby certify that I have been the person responsible for overseeing the examination of the Facility. I am familiar with the provisions of federal regulations 40 CFR 110, 112, 116, 117 and 302, attest to the best of my knowledge that this SPCCP/ISCP was prepared in accordance with reasonable and prudent engineering practices and satisfies the current requirements of the aforementioned regulations.

APPENDIX A

IMMEDIATE CORRECTIVE ACTIONS

IMMEDIATE CORRECTIVE ACTIONS TO IMPLEMENT THE SPCC PLAN IN EVENT OF SPILL

The following is a list of corrective measures and actions to immediately implement in the event of a spill:

1. Contain the spill as best possible with readily available means to prevent the spill from migrating to a larger area. Control devices such as spill control booms and absorbent material should be used. Personnel safety will remain first priority.
2. Assure that all sanitary and storm sewer systems are protected so that the spill is prevented from entering and contaminating the systems. As stated earlier, control devices such as spill control booms and absorbent material should be used.
3. Senior personnel in charge at the spill site should prepare the Preliminary Alert Procedure Checklist attached in Appendix C and immediately notify the Unit Environmental Action Coordinator and/or Facility Environmental Action Coordinator. The senior personnel should notify the Facility Manager and/or Staff Duty Officer in the event of the unavailability of either Environmental Action Coordinator. The senior person on the scene should immediately notify the fire department and/or ambulance service if it is necessary. Emergency telephone numbers are included in the Emergency and Spill Response Action List attached in Appendix B.
4. Await further instructions from the Environmental Action Coordinators.

FEBRUARY 1995

EXECUTIVE SUMMARY

In November 1993, four underground storage tanks (USTs) were removed from the U.S. Army Reserve Center, Wilmington, North Carolina by Environmental Technology of North America, Incorporated (ETI). All the tanks contained heating oil (No. 2 Fuel Oil) for consumptive use on the premises. One of the tanks, UST Army No. 1, had a small hole at the base of the tank. The soil sample from the excavation stockpile of USTs Army No. 1 and 2 measured 1320 parts per million (ppm) total petroleum hydrocarbons (TPH) using EPA Method 3550. Approximately 33 cubic yards of soil were removed from the excavation of USTs Army No. 1 and 2 and disposed at the ETI Bioremediation Facility in Fayetteville, North Carolina.

A site assessment was conducted to determine the extent of damage from the release of UST Army No. 1. The field work for the investigation was performed from March through June 1994. Soil samples were collected from six shallow and one deep soil borings. Monitoring wells were installed in the six shallow borings.

The soil samples were analyzed for TPH using EPA Method 3550. The soil samples ranged from below detection limit to 133 ppm TPH. However, based on the Site Sensitivity Evaluation (SSE) the soil at the site is below the final cleanup level of 240 ppm.

Groundwater samples were collected from the monitoring wells, as part of the investigation. The samples were analyzed for lead, semi-volatile and volatile organics. The lead levels in the wells exceeded the North Carolina regulatory limit except for MW-3-94. Lead is believed to be naturally occurring at the site. All of the wells are clean except for MW-3-94 based on the analytical results for semi-volatile and volatile organics. The analytical results also indicate the contamination has not migrated off site. The maximum contaminant concentration was 2-Methylnaphthalene at 0.343 ppm. No samples were collected from MW-1-94 as the well contained approximately seven inches of free product. Six temporary wells were also installed in an effort to locate a free product plume surrounding MW-1-94.

The site is surrounded by residential areas and municipal facilities and is served by public water supply and sewer. A small recreational lake is also adjacent to the site but is not a water supply reservoir. No water supply intakes are located within 1500 feet of the site.

The site contamination is limited to the groundwater in a small area north of UST No. 1 based on the results of the investigation. The soil contamination is below the SSE Final

U.S. Army Reserve Center
Wilmington, North Carolina

Site Assessment
February 1995

Cleanup Level and the source has been removed. The seven inches of free product in MW-1-94 is the primary environmental concern.

Accordingly, a free product recovery system is recommended for site remediation along with semi-annual groundwater monitoring.

I. GENERAL INFORMATION

1.0 SITE HISTORY AND SOURCE CHARACTERIZATION.

1.1 **Site Description.** The U.S. Army Reserve Center is located in the western part of Wilmington, North Carolina at 2144 West Lake Shore Drive (Plates 1 and 2). Municipal and residential areas surround the site. It is bordered by Stadium Drive and a residential area to the north, by Greenfield Lake to the east, the City of Wilmington Fire Tower to the south, and Legion Stadium to the west. The surrounding property owners are identified in Table 1. The site contains a training facility, a vehicle maintenance shop, and storage warehouse. The U.S. Army Reserve 650th and 993rd Transportation Companies utilize the site for training and equipment storage. The training facility is also used by the U.S. Naval and U. S. Coast Guard Reserves. A site plan is shown on Plate 3.

1.2 **Site History.** The U.S. Department of Army purchased 4.26 acres of land from the City of Wilmington, North Carolina and constructed a training facility and vehicle maintenance shop in the late 1950's. A 2000-gallon underground storage tank (UST) containing heating oil was installed during construction for heating the training facility. A 550-gallon heating oil UST was also installed during construction for heating the vehicle maintenance shop.

Several additions have been made to the training facility and maintenance shop since the original construction. In the 1970's the U.S. Department of Navy added additional office space to the training facility including a 1000-gallon UST for heating oil. Also the late 1970's, the original 2000-gallon UST was abandoned in-place and replaced with a 5000-gallon UST during a boiler replacement for the training facility. During the mid-1980's, the vehicle maintenance shop was expanded. The original 550-gallon UST was probably replaced with a 1000-gallon fiber glass UST during this construction.

In November 1993, Environmental Technology of North America, Incorporated (ETI), of Greensboro, North Carolina removed all four of the USTs from the site. The removal of the USTs was documented in the three closure reports. One report described the removal and sampling of the 1000-gallon UST (Navy No. 1) used by the U.S. Navy for the training facility. A second report described the removal and sampling of the 2000-gallon and 5000-gallon USTs (Army No. 1 and 2) used by the U.S. Army for the

U.S. Army Reserve Center
Wilmington, North Carolina

Site Assessment
February 1995

training facility. The third report described the removal and sampling of the 1000-gallon UST (Army No. 3) used by the U.S. Army for the vehicle maintenance shop. Two copies of each report were submitted to Mr. Rick Shiver, North Carolina Division of Environmental Management (NCDEM) Wilmington Regional Office, with a letter dated 15 February 1994 by the U.S. Army Corps of Engineers (USACE), Wilmington District.

The tank closure reports stated that all of the USTs were in good condition and no holes were observed except for UST Army No. 1 which had a small hole at the base of the tank. Corrective action during the tank removals included the removal 33 cubic yards of soil from the excavation of USTs Army No. 1 and 2. These excavations were backfilled with clean soil. The excavated soil was treated off site at the ETI Bioremediation Facility in Fayetteville, North Carolina. The excavations of the USTs Navy No. 1 and Army No. 3 were backfilled with the excavated soil as no contamination was indicated by field screening procedures and then confirmed by closure samples as indicated in Section 1.3.2.

1.3 Previous Investigations. Previous sampling events at the site were focused on the four USTs. Samples were collected from the site in July 1993, November 1993, and February 1994. The following paragraphs summarize these investigations.

1.3.1 July 1993 Soil Investigation. On 29 - 30 July 1993, soil samples were collected from the tank sites to assist in preparing the cost estimate for the removal of the USTs. Plate 4 displays the sample locations. Nine soil samples were collected from just above the groundwater level using a stainless steel hand auger. The sample depths ranged from 3.5 to 6 feet, below ground surface (bgs).

Six samples were analyzed for TPH using United States Environmental Protection Agency (EPA) Draft Method 4030, an immunoassay screening technique with detection limits of 15 ppm and 75 ppm TPH for No. 2 Fuel Oil. The North Carolina regulatory limit for high boiling point fuels is 40 ppm TPH. The sampling results are summarized in Table 2. The samples collected from the B6-93 and B7-93 located near USTs Army No. 1 and 2 tested positive for TPH greater than 15 ppm and TPH greater than 75 ppm. Samples collected from the areas near UST Navy No. 1 and Army No. 3 tested negative for TPH.

USACE, Wilmington District notified Mr. Kirk McDonald, NCDEM, Wilmington Regional Office, by telephone on 3 August 1993 concerning the suspected release from an UST. In addition to the telephone conversation, a letter dated 10 August 1993 was mailed to Mr. Rick Shiver, NCDEM, Wilmington Regional Office confirming

the 3 August 1993 telephone conversation.

1.3.2 November 1993 Tank Removal. Soil and groundwater samples were also collected in November 1993 at the time of tank closure and sent to a laboratory for analysis as documented in the tank closure reports. Seven soil samples were analyzed for TPH using EPA Methods 5030/8015 and 3550/8015 with a detection limit of 10 ppm. Table 3 lists the soil sampling results. Samples of the stockpiled soil from USTs Army No. 1 and No. 2 excavations measured 1320 ppm TPH using EPA Method 3550/8015. All other soil samples were below the North Carolina regulatory limits of 10 ppm TPH for low boiling point fuels and 40 ppm TPH for high boiling point fuels.

Groundwater samples were collected from the UST Army No. 2 and UST Navy No. 1 excavations. The groundwater samples were analyzed using EPA Method 624 for volatile organics and EPA Method 625 for semi-volatile organics. All parameters tested for the UST Navy No.1 were below the detection limit (BDL). The results for UST Army No. 2 groundwater sample indicated petroleum contamination and are presented in Table 4.

1.3.3 February 1994 Investigation. On 16 February 1994, soil samples were collected for additional site characterization in the vicinity of UST Army No.1 and No. 2. Plate 5 displays the sample locations. Seven soil samples were collected from soil borings using a stainless steel hand auger. The samples were analyzed for TPH using EPA Draft Method 4030, an immunoassay screening technique with detection limits of 15 ppm and 75 ppm TPH for No. 2 Fuel Oil. Table 5 summarizes the sampling results. Four of the seven samples tested positive for TPH greater than 75 ppm, which exceeds the North Carolina regulatory limit of 40 ppm for high boiling point fuels. However, pieces of asphalt in the samples may have caused a positive result for the samples from borings B-4-94 and B-7-94.

2.0 POTENTIAL RECEPTORS AND MIGRATION PATHWAYS.

The potential receptor of primary concern is Greenfield Lake which is adjacent to the site. Greenfield Lake is not a water supply reservoir and receives stormwater runoff from various areas of the City of Wilmington. A sanitary sewer runs through the contaminated area and could serve as a potential migration pathway. The site and the surrounding areas are served by the City of Wilmington public water and sewer. The site has used public water and sewer since original construction in the late 1950's. No water supply intakes are located within 1500 feet of the site. The water supply intake for the City of Wilmington is

located above Lock and Dam No. 1 on the Cape Fear River in southeastern Bladen County approximately 30 miles northwest of Wilmington.

II. SITE ASSESSMENT INVESTIGATION AND CONCLUSIONS

3.0 SOILS INVESTIGATION.

The soil investigation for the site assessment was conducted during 9 - 11 March 1994. Seven borings were drilled in the area surrounding USTs Army No. 1 and No. 2. Soil samples were collected for field classification using the Unified Soil Classification System. The boring logs are presented in Appendix B. These soil samples were also screened for the presence of volatile organic compounds using organic vapor analyzer (OVA) and a photoionization detector (PID). One soil sample was also collected for the purpose of chemical analysis from each borehole and analyzed for TPH using EPA Method 3550/8015. Monitoring wells were installed in all of the boreholes except CS-1-94. The standard operating procedures used for the investigation are presented in Appendix A.

3.1 Soil Investigation Methodology.

3.1.1 Soil Boring Procedures. Six shallow borings and one deep boring were drilled and sampled during the site investigation. The soil boring locations are displayed on Plate 6. Previous sampling results were used to select the boring locations. The deep boring, CS-1-94, was drilled approximately 30 feet, bgs. The soil samples for this boring were collected with a 1.375-inch splitspoon sampler. Five of the shallow borings (MW-1-94, MW-2-94, and MW-4-94 through MW-6-94) were drilled approximately 17.5 feet, bgs. The soil samples for these borings were collected with a 1.375-inch splitspoon sampler. The sixth shallow boring, MW-3-94, was drilled to 9.5 feet, bgs using a 4-inch stainless steel hand auger. The soil samples were also collected using the hand auger. The borehole elevations were surveyed by using a sanitary sewer manhole elevation as a benchmark, as shown on Plate 6. The drilling equipment was decontaminated before setting up on the first borehole and between each location.

3.1.2 Soil Sampling Procedures for Engineering Classification. The soil samples collected for field classification were first placed in a new glass mason jar and covered with clean aluminum foil secured by the lid for organic vapor screening. Both OVA and PID readings were taken for the field samples. After the organic vapor screenings were complete,

the samples were transferred to a plastic sample jars for future reference. The soil classifications are addressed in Section 3.2.

3.1.3 Soil Sampling Procedures for Chemical Testing.

The soil samples collected for analytical testing were removed from the splitspoon sampler or hand auger and immediately placed in a clean glass jar with a teflon lined lid. The sample was then placed on ice to maintain a temperature of 4°C during transport to the laboratory. A new pair of sterile latex gloves was used for the collection of each sample. A chain of custody record was maintained to ensure sample integrity upon receipt by the laboratory. The soil samples were analyzed for TPH using EPA Method 3550/8015. Section 3.3.2 discusses the analytical results.

3.2 Site Geology. The soils encountered during the drilling consisted of unconsolidated material. Sample descriptions from soils borings were generally described as alternating layers of silty sand (SM) and poorly graded sand (SP). The thickness of the individual layers varies. Castle Hayne limestone was encountered at approximately 30 feet, bgs or at elevation -15 feet, mean sea level (msl) in boring CS-1-94. There are no faults or other structures known to exist near the site. No natural lithologic developments occur which could cause preferential paths of groundwater flow. The top of the unconfined aquifer is between 6 and 7 feet, bgs or between 7 and 8 feet, msl. The locations of geological cross sections are shown on Plate 7. Cross sections A-A (Plate 8) and B-B (Plate 9) illustrate the soil types, unconfined aquifer, OVA readings, and soil analytical results.

3.3 Soil Contamination.

3.3.1 Site Sensitivity Evaluation. The NCDEM Site Sensitivity Evaluation (SSE) yields a total site characteristic score of 130, as shown in Table 6. Table 7 indicates an initial cleanup level of 80 ppm TPH based on EPA Method 3550/8015. The site meets criteria for Category E which is defined as no known water supply wells contaminated within 1500 feet and the area is served by public water supply. Therefore, the final cleanup level for the site is 240 ppm as demonstrated in Table 7.

3.3.2 Soil Analytical Results. One soil sample was collected from each borehole and analyzed for TPH using EPA Method 3550/8015. Plates 6, 8, and 9 illustrate the soil sampling locations and analytical results. Table 8 summarizes the soil analytical results. The sample TPH results ranged from below BDL to 133 ppm. Six of seven soil samples were collected

from just above the groundwater level. The seventh sample, CS-1-20-94, was collected from approximately 30 feet, bgs to assess the vertical migration of the contamination. MW-3-2-94 was collected as quality control and quality assurance sample. However, the sampler did not thoroughly mix the sample prior to placing the samples in the sample jars. As a result, the TPH analytical results were 0, 51.7, and 133 ppm TPH for MW-3-94. The analytical results are below the SSE final cleanup level of 240 ppm TPH. The analytical results and chain of custody forms are located in Appendix C.

4.0 GROUNDWATER INVESTIGATION.

The groundwater investigation for the site assessment focused on the area surrounding the former USTs Army No. 1 and No. 2. Six shallow monitoring wells were installed and developed during 9 - 12 March 1994. The monitoring wells were sampled on 4 - 5 April 1994. The groundwater samples were analyzed for lead, semi-volatile organics, and volatile organics. No samples were collected from MW-1-94 due to presence of roughly 7 inches of free product. On 5 - 6 May 1994, six temporary wells were installed in an effort to locate the free product plume. Free product measurements were made between 9 May 1994 and 8 June 1994. The temporary wells were removed and grouted with neat cement on 8 June 1994. The standard operating procedures used for the investigation are presented in Appendix A.

4.1 Groundwater Investigation Methodology.

4.1.1 Monitoring Well Installation. Six shallow monitoring wells were installed in the area surrounding the USTs Army No. 1 and No. 2. The locations of the wells are shown on Plate 3. Five of the wells are 15.5 in depth with 10-foot screens and the sixth well MW-3-94 is 9.5 feet in depth with a 5-foot screen. The well screens were set as to straddle the water table as the contaminant of concern is No. 2 Fuel Oil.

All of the monitoring wells are constructed of flush jointed 2-inch diameter Schedule 40 polyvinyl chloride (PVC) riser pipe and 0.010-inch slotted PVC screen. A sand filterpack was placed to a depth approximately 1 to 1.5 feet above the level of the top of the screen. A bentonite pellet seal was then placed to a depth of 1 to 1.5 feet above the sand filterpack. The boreholes were grouted to the surface with neat cement grout. All wells were finished flush with the ground surface as the areas are subject to vehicle traffic. Monitoring well elevations were surveyed by using a sanitary sewer manhole elevation as a benchmark, as shown on Plate 3. Table 9 presents the monitoring well data. The well construction records, diagrams, and boring

logs are located in Appendix B.

4.1.2 Groundwater Sampling Procedures. All of the monitoring wells were sampled on 4 - 5 April 1994. First, the well head space was monitored with an OVA. Next, the groundwater level was determined using a water level indicator and free product measurements were made using Kolor Kut gauging paste. Three well volumes were removed using a new disposable polyethylene bailer for each well. Groundwater samples were collected for lead, volatile organics, and semi-volatile organics from each well except for MW-1-94. The groundwater analytical results are presented in Section 4.3.1. No samples were collected from MW-1-94 due to presence of free product. The samples were placed on ice to maintain a temperature of 4°C during transport to the laboratory. A new pair of sterile latex gloves was used for the collection of each sample. A chain of custody record was maintained to ensure sample integrity upon receipt by the laboratory.

4.1.3 Temporary Well Installation. On 5 - 6 May 1994, six temporary wells were installed using a power auger in an effort to locate a free product plume. Plate 11 displays the locations of the temporary wells. The auger flights were decontaminated between each boring. The wells varied in depth from approximately 5.1 to 6.8 feet, msl. The temporary wells were constructed of flush jointed 2-inch diameter Schedule 40 PVC riser pipe and 0.010-inch slotted PVC screen. OVA readings in the boreholes ranged from 50 ppm for TW-4 to plus 1000 ppm in TW-3. Temporary well elevations were surveyed by using a sanitary sewer manhole elevation as a benchmark, as shown in Plate 11. On 8 June 1994, the six temporary wells were removed and the boreholes grouted with neat cement grout. Table 10 presents the temporary well construction details and the borehole OVA readings.

4.2 Site Hydrogeology. At the site, the top of the unconfined aquifer varies from 6 to 7 feet, bgs or between elevations 7 and 8 feet, msl as shown on the geological cross sections on Plates 8 and 9. The locations of the cross sections are shown on Plate 7. The groundwater recharge occurs by infiltration. Groundwater moves downward and laterally to discharge into Greenfield Lake.

An assessment of the horizontal groundwater flow direction for the site is shown on Plate 10. The groundwater elevation contours shown on Plate 10 were produced from groundwater levels recorded in the monitoring wells on 4 - 5 April 1994 prior to sampling. Table 9 presents the groundwater level measurements for 4 - 5 April 1994. The monitoring wells were developed on 12

March 1994. Generally, groundwater at the site flows eastward. The average hydraulic gradient indicated by the contours is one percent. No significant features or activities appear to be affecting the groundwater flow patterns at the site.

4.3 Groundwater Contamination.

4.3.1 Groundwater Analytical Results. On 4 - 5 April 1994, groundwater samples were collected from all of the monitoring wells except MW-1-94 due to the presence of free product. The analytical results from the groundwater sampling are summarized in Table 11 and displayed on Plate 11. MW-3-94 was collected as quality control and quality assurance sample. The samples were analyzed for lead using EPA Method 7421 or 239.2, semi-volatile organics using EPA Method 8270 or 625 and volatile organics using EPA Method 8020 or 602.

The lead levels exceeded the Title 15A North Carolina Administrative Code (NCAC) Subchapter 2L groundwater standards except for MW-3-94 as shown in Table 11. The turbidity of the samples may have increased the lead levels. However, it is believed lead is natural occurring at the site as the lowest levels were found in the most contaminated well, MW-3-94.

The volatile organic levels do not exceed the 15A NCAC 2L groundwater standards except for benzene in MW-3-94. EPA Method 8270 and 625 identified nine additional compounds associated with petroleum products in MW-3-94 as shown in Table 11. The compound with the highest concentration was 2-Methylnaphthalene at 0.343 ppm. No semi-volatile organics were identified in the other wells. The groundwater analytical results indicate the contamination is limited to the immediate area surrounding the tanks and has not migrated off site.

4.3.2 Free Product Measurements. Free product measurements were made on 4 - 5 April 1994, 9 May 1994, 23 May 1994, and 8 June 1994 using Kolor Kut gauging paste. Free product has only been detected in MW-1-94 in amounts varying from 5.5 to 7 inches as shown on Plate 11. The temporary wells were not developed, therefore, the silty sand may have clogged the temporary well screens preventing free product from entering the wells. The soil below the groundwater level appeared to be contaminated with fuel in TW-3, TW-5, TW-6 and the borehole OVA readings during well installation were 1000 ppm, 500 ppm, and 200 ppm, respectively.

5.0 RECOMMENDATIONS. The primary concern at this site is groundwater contamination not soil contamination based on the

field work and analytical results. The contamination is limited to a small area north of the former Army USTs No.1 and No. 2. Remedial action is required to address the free product in MW-1-94. The installation of a free product recovery system in the area downgradient of MW-1-94 should be sufficient to correct the groundwater contamination problem along with semi-annual monitoring.

Site Characteristics Evaluation (Step 1)

Characteristic	Condition	Rating	
Grain Size*	Gravel	150	100
	Sand	100	
	Silt	50	
	Clay	0	
Are relict structures, sedimentary structures, and/or textures present in the zone of contamination and underlying "soils"?	Present and intersecting the water table.	10	0
	Present but <u>not</u> intersecting the water table.	5	
	None present.	0	
Distance from location of deepest contaminated soil** to water table.	0 - 5 feet (C, D & E sites only)	20	20
	5 - 10 feet	20	
	>10 - 40 feet	10	
	> 40 feet	0	
Is the top of bedrock or transmissive indurated sediments located above the water table?	Yes	20	0
	No	0	
Artificial conduits present within the zone of contamination.	Present and intersecting the water table.	10	10
	Present but <u>not</u> intersecting the water table.	5	
	Not present.	0	
		Total Site Characteristics Score:	130

* Predominant grain size based on Unified Soil Classification System or U.S. Dept. of Agriculture Soil Classification Method.

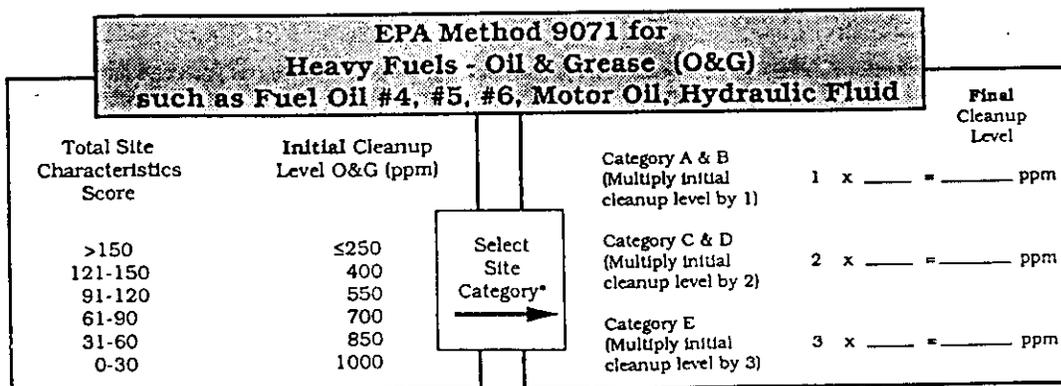

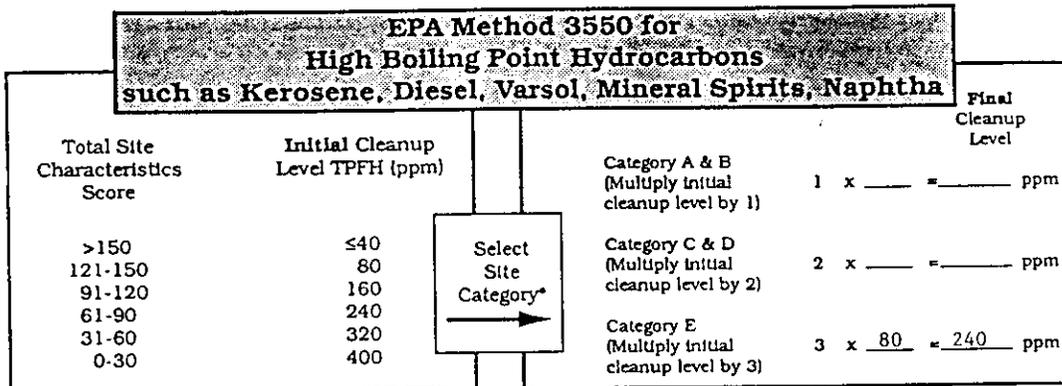

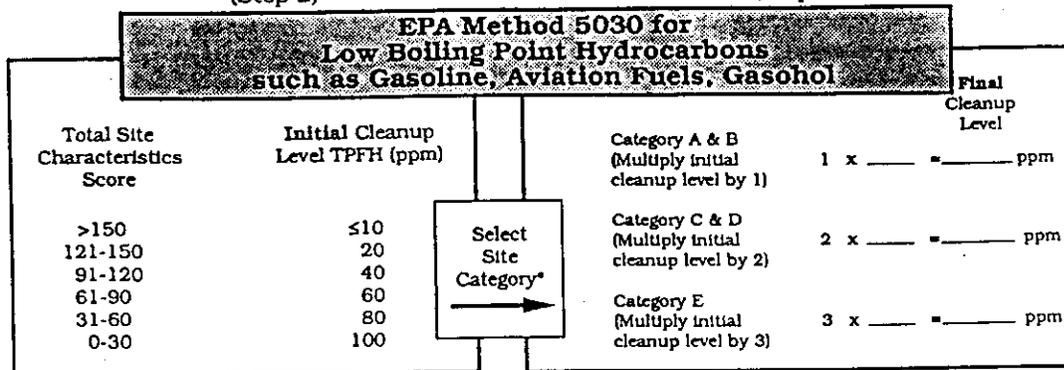

** (>10 ppm TPFH by Method 5030; >40 ppm TPFH by Method 3550; >250 ppm O&G by Method 9071)

1. PROJECT DESCRIPTION

The objective of this investigation is to complete the field work for a Comprehensive Site Assessment (CSA) at the Wilmington Army Reserve Center (ARC). Previous investigations have identified a possible release from an underground storage tank (UST) containing heating oil (No. 2 Fuel Oil). The specific goals of this project include; 1) determining the cause and extent of groundwater and soil contamination, 2) identifying potential public health and environmental risks, and 3) defining future investigations or actions required for the site.

This work effort will be performed by U.S. Army Corps of Engineers (USACE). The USACE Wilmington District will oversee the project with support from the USACE Savannah District. The description of work for this project involves the activities described below:

1) Prepare and submit a Chemical Data Acquisition Plan (CDAP). This will be done by Wilmington District personnel.

2) Prepare and submit a Site Safety and Health Plan (SSHP). This will be done by Savannah District personnel. The SSHP will be submitted and approved prior to the initiation of any field work at the site.

3) Install and develop seven monitoring wells. This will be done by Savannah District personnel.

4) Collect soil samples for geotechnical and chemical analysis from each well boring. This will be done by Savannah District personnel.

5) Collect groundwater samples from the monitoring wells. This will be done by Wilmington District personnel.

6) Analyze the groundwater samples for lead, purgeable aromatic hydrocarbons and semi-volatile organics. Analyze the soil samples for total petroleum hydrocarbons (TPH). The primary and quality control samples will be analyzed by Specialized Assays, Nashville, Tennessee. The quality assurance samples will be analyzed by James H. Carr & Associates, Columbia, South Carolina. A Quality Assurance Report will be prepared by the South Atlantic Division (SAD) Laboratory.

7) Prepare and submit a Comprehensive Site Assessment to the State of North Carolina which provides an assessment of the site based on the field work and analyses performed. This will be performed by personnel from the Wilmington District. The report will be submitted to the 120th ARCOM for review and approval prior to being submitted to the State of North Carolina.

1.1 Site Description. The Army Reserve Center (ARC) is located in the western part of Wilmington, North Carolina at 2144 West Lake Shore Drive (Figure 1). Municipal and residential areas surround the facility. It is bordered by a residential area to the north, by Greenfield Lake to the east, the City of Wilmington Fire Tower to the south, and Legion Stadium to the west. The facility contains an office building, a maintenance facility, and storage warehouse. The office building is also used by the Navy and Coast Guard Reserves. The facilities are used for training, storage, and vehicle maintenance. A site map is shown in Figure 2.

1.2 Previous Investigations. During November 1993, four USTs were removed from the Wilmington ARC (Figure 2). The USTs contained No. 2 Fuel Oil for consumptive use on the property and ranged in size from 1000 gallons to 5000 gallons. Previous sampling events have focused on releases from these USTs. Samples have been collected from the site in August 1993, November 1993, and February 1994. The following sections summarize the sampling results.

1.2.1 August 1993 Investigation. In August 1993, soil samples were collected from the tank sites to assist in preparing the cost estimate for removal. Nine soil samples were collected from hand augered borings using a stainless steel auger. Six samples were analyzed for TPH using United States Environmental Protection Agency (EPA) Draft Method 4030, a immunoassay screening technique with detection limits of 15 parts per million (ppm) and 75 ppm TPH for No. 2 Fuel Oil. The North Carolina regulatory limit for high boiling point fuels is 40 ppm TPH. The sampling results are summarized in Table 1. The sample locations are shown in Figure 3.

1.2.2 November 1993 Investigation. Soil and groundwater samples were also collected in November 1993 at the time of tank closure and sent to a laboratory for analysis. Seven soil samples were analyzed for TPH using EPA Methods 5030/8015 and 3550/8015 with a detection limit of 10 ppm TPH. The soil sampling results are summarized in Table 2. The sample locations are shown in Figures 4 through 6. Groundwater samples were collected from the 5000-gallon UST (Army No. 2) and 1000-gallon (Navy No. 1) excavations. The groundwater samples were analyzed using EPA Methods 602 and 625. The Navy No.1 sample did not exceed any of the State of North Carolina ground water standards. The Army No. 2 groundwater samples exceeded the State of North Carolina groundwater standards.

1.2.3 February 1994 Investigation. In February 1994, soil samples were collected for additional site characterization in the vicinity of the 2000 and 5000-gallon USTs. Seven soil samples were collected from hand augered borings using a stainless steel auger. The samples were analyzed for TPH using EPA Draft Method 4030, a immunoassay screening technique with detection limits of 15

1.3 Project Schedule. The investigation activities will include approximately three weeks of field work, followed by two weeks of laboratory testing and analysis. The field work will commence after approval of the CDAP and the SSHP. It is expected that the well installation and sampling will be completed during March 1994. The soil and water collected from the monitoring wells will be shipped to the commercial testing laboratory. The laboratory testing will start with the arrival of the first field sample. It is anticipated the report will be completed by mid-May 1994.

2. FIELD INVESTIGATION.

The purpose of this field investigation at the Wilmington ARC is to define the areal and vertical extent of petroleum hydrocarbon contamination in the area of the 2000 and 5000-gallon USTs which were removed in November 1993. This section of the CDAP discusses the field activities planned to accomplish this goal. The chemical sampling and analytical programs are discussed in Section 3.0 of this plan. The field investigation at this site can be divided into three primary activities:

- * Monitoring Well Borings
- * Monitoring Well Design and Installation
- * Topographic Survey
- * Investigation Derived Waste

The specific field activities include the installation of six (6) shallow and one (1) deep monitoring well. All wells shall be flush mounted. For estimating purposes the shallow wells shall be 10 to 15 feet in depth with a 5-foot screen and 2 inches in diameter. The screens for the shallow wells shall be placed as to saddle the water table. The deep well shall be a telescoping well approximately 35 feet in depth with a 10-foot screen with a 4 or 6-inch outer casing and 2-inch inner casing. Chemical and geotechnical samples shall be collected from the monitoring well borings. The following sections discuss the proposed techniques for performing each of these elements.

2.1 Monitoring Well Borings. Monitoring wells will be required to investigate the vertical and horizontal extent of petroleum hydrocarbons contamination. The proposed monitoring well locations are shown on Figure 2. Soil samples for chemical analysis will be required from borings drilled for monitoring well installations. All borings for monitoring well installations shall be drilled and sampled according to the following requirements.

2.1.1 Regulatory Requirements. All borings shall be drilled in accordance with all federal, state, and local requirements.

2.1.2 Utility Clearances and Permits. The Wilmington District will be responsible for obtaining and coordinating all utility clearances and drilling permits. N.C. Utility Services will be contracted to mark and flag the proposed drilling area. If it is necessary to move a boring in order to avoid utilities, the drill inspector shall be responsible for relocating the boring to a suitable location which accomplishes the intent of the original location. The new location shall be as close as possible to the original location. Both locations shall be shown on the boring log. The drill crew and inspector shall take all reasonable precautions to protect persons and property near the drill site.

2.1.3 Drilling Methods and Decontamination. All borings shall be drilled by a method of the Savannah District selection. The method(s) shall be proposed by the Savannah District and approved by the Wilmington District prior to use. The drilling method must allow, or provisions must be made for, accurate determination of the depth to groundwater surface. If a well is to be installed in a boring, the boring shall be of sufficient diameter to permit at least two inches of annular space between the boring wall and the sides of the centered riser and screen. The boring diameter shall be of sufficient size to allow for the accurate placement of the screen, riser and centralizers, filter pack, bentonite and grout.

All sampling equipment shall be decontaminated according to Section 3.4. All drill pipe, drilling tools, etc. shall be free of potentially contaminating materials (i.e. grease, oil, paint, etc.) and shall be steam cleaned prior to use at each well/boring. The drill rig shall be steam cleaned prior to use at the site. The rig shall be free of leaks which could contaminate the holes (i.e. hydraulic fluid, oil, gas, loose paint, etc.). No grease shall be used on drill pipe joints. The use of any lubricants shall be not be permitted.

2.1.4 Geotechnical Sampling Requirements. During drilling of all borings, soil sampling shall be performed at regular intervals to allow for accurate logging of the soil lithology. Sampling may be performed using a split spoon sampler or thin wall (Shelly tube) sampler using the techniques given in ASTM D 1586 and ASTM D 1587, respectively. Other type samplers (California split tube, hollow stem auger continuous sampler, etc.) may also be used. All samplers used to collect samples for chemical analysis shall be stainless steel. Samples to be used only for logging may be taken with sampling devices which are not stainless steel.

2.1.4.1 Lithologic Logging. Soil samples for lithologic logging shall be collected every 2.5 feet for the first ten feet and every five feet for the remaining depth of each boring for the shallow wells. For the deep well, continuous split spoon sampling is required. Material recovered from geotechnical sample

intervals may also be utilized to meet the requirements for chemical sampling, i.e. a sample for geotechnical testing and a sample for chemical analysis may be taken from the same split spoon after the material is logged. Where the material quantity is insufficient to meet all needs, samples for chemical analysis shall be collected first.

2.1.4.2 Soil Classification. All soil samples shall be visually classified in the field using the Unified Soil Classification System (ASTM D 2488). In order to verify, the field classifications and to obtain additional data on the composition of the subsurface materials, the Savannah District Drill Crew shall retain a minimum of two samples per boring for future geotechnical testing if required. In monitoring well borings, one of the samples to be tested shall be taken from the screened portion of the aquifer and one from the unsaturated zone.

2.1.5 Logs. All drill logs shall subscribe to the following requirements:

1) Logs shall be prepared in the field, as borings are drilled, by a qualified, experienced geologist or geotechnical engineer. Each log shall be signed by the preparer.

2) All log entries shall be printed. Photo reproductions shall be clear and legible. Illegible or incomplete logs will not be accepted. One legible copy of each field log shall be completed and sent to the Wilmington District within five days of completion of field work. The boring will not be accepted by the Wilmington District before the drilling logs are received and approved.

3) Borehole depth information shall be from direct measurements accurate to one-tenth of a foot.

4) Logs shall be prepared on the HTW Drilling Log form as shown in Appendix A.

5) All relevant information blanks in the log heading and log body shall be completed. If surveyed horizontal control is not available at the time of drilling, location sketches referenced by measured distances from prominent surface features, shall be shown on, or attached to the log.

6) Log scale shall be 1-inch = 1-foot.

7) Each and every material type encountered shall be described in column c of the log form. (Material types are to be logged directly from samples and indirectly interpolated using professional judgement, drill cuttings, drill action, etc., between sampling intervals.)

8) Unconsolidated materials shall be described as

outlined below and in the following sequence:

Descriptive USCS classification in accordance with ASTM D 2488 - 84;

Consistency of cohesive materials or apparent density of non-cohesive materials;

Moisture content assessment, e.g., moist, wet, saturated, etc.;

Color;

Other descriptive feature (bedding characteristics, organic materials, macrostructure of fine-grained soils e.g., root holes, fractures, etc.);

Depositional type (alluvium, till, loess, etc.).

9) Rock materials shall be described in the sequence outlined below and in accordance with standard geologic nomenclature, including:

Rock type;

Relative hardness;

Density;

Texture;

Color;

Weathering;

Bedding;

Fractures, joints, bedding planes, and cavities, including any filling material and whether open or closed;

Rock Quality Designation (RQD)

Other descriptive features (fossils, pits, crystals, etc.).

10) Stratigraphic/lithologic changes shall be identified in column c by a solid horizontal line at the appropriate scale depth on the log which corresponds to measured borehole depths at which changes occur, measured and recorded to the nearest one-tenth of a foot. Gradational transitions, changes identified from cuttings or methods other than direct observation and measurement

shall be identified by a horizontal dashed line at the appropriate scale depth based on the best judgment of the logger. All lines shall be drawn with a straight edge and not by free hand.

11) Logs shall clearly show in columns e and f, the depth intervals from which all samples are retained.

12) Logs shall identify the depth at which water is first encountered, the depth to water at the completion of drilling and the stabilized depth to water. The absence of water in borings shall also be indicated. Stabilized water level data shall include time allowed for levels to stabilize.

13) Logs shall show borehole and sample diameters and depths at which drilling or sampling methods or equipment change.

14) Logs shall show total depth of penetration and sampling. The bottom of the hole shall be clearly identified on the log with the notation "Bottom of Hole."

15) Logs shall identify any drilling fluid losses including depths at which they occur, rate of loss and total volume lost.

16) Logs shall show drilling fluids used including, as appropriate:

source of make-up water;

drill fluid additives by brand and product name, and mixture proportions; and

type of filter for compressed air.

17) Logs shall show depths and types of any temporary casing used.

18) Logs shall identify any intervals of hole instability.

19) Intervals of lost bedrock core shall be shown in column e. Intervals of intact soil sampling attempts shall also be shown in column e, including depths from which attempts were made and length of sample recovered from each attempt. Bedrock coring information shall be recorded in consecutively numbered runs in column h and shall include the following:

start and stop time of each core run;

depth to top and bottom of each core run;

length of core recovered from each run.

size and type of coring bit and barrel; and

measured depth to the bottom of the hole after core is removed from each run.

20) Any special drilling or sampling problems shall be recorded on logs, including descriptions of problem resolutions.

21) Logs shall include all other information relevant to a particular investigation, including but not limited to :

odors;

PID/FID measurements or other field screening or test results; and

any observed evidence of contamination in samples, cuttings or drilling fluids.

22) Copies of the field logs shall be included in the draft report and final report; drafted boring logs shall be submitted in the final report.

2.1.6 Backfilling. All borings shall be backfilled with grout or tamped cuttings. The borings shall be backfilled immediately after the sampling is completed unless saturated conditions have been encountered or a monitoring well is installed. In borings encountering saturated conditions, a 24-hour ground-water level shall be measured before backfilling. Borings left open overnight shall be covered to lessen the potential for injury to personnel and to minimize the potential for any surface drainage entering the boring.

2.1.7 Site Restoration. The site shall be restored to the condition prior to field work that is acceptable to the owner/base/facility within 5 days of the completion of the site investigation. **High visible areas or high traffic areas shall be immediately restored upon completion of the site investigation.** Drums (if used) shall be staged to a pre-designated drum staging area specified by the owner as part of this site restoration. The drums shall be placed on wooden pallets for temporary storage. The Facility Manager shall provide the final approval of the site restoration.

2.2 Well Design and Installation. The wells shall be constructed according to all applicable federal, state and local requirements. Monitoring well standards for the State of North Carolina are listed in Appendix B. All well materials shall be steam cleaned immediately before installation and shall remain clean until installed in the boring or the material shall be steam cleaned again. The specifications to be are listed below.

2.2.1 Well Screen. The drill crew and inspector shall have the responsibility of selecting the screened area of the borehole so that the completed monitoring well provides data which meets the project data quality objectives. Well screen shall be constructed of the same size and strength material as the well riser. Field slotted screen is not permitted. The slot size shall be Schedule 40 PVC Slot Size 0.010. For water table wells, normal, seasonal fluctuations in the water table elevation shall be taken into consideration when placing the well screen so that monitoring will be possible throughout an average year. Normal fluctuations shall be determined through a review of local well records and available literature.

2.2.2 Filter Pack. The annular space around the well screen shall be backfilled with a clean, washed, well-rounded silica sand sized to perform as a filter between the formation material and the well screen. The grain size of the filter pack which is used shall be shown on the well construction log. The filter pack material shall be tremied into place to avoid bridging and insure a continuous filter pack throughout the screened interval of the well. The filter pack shall extend approximately 1 foot below, and 2 to 4 feet above the well screen.

2.2.3 Well Riser. Well riser shall consist of polyvinyl chloride(PVC). PVC pipe shall be new, threaded, flush joint, and as a minimum, conform to the requirements of ASTM F 480-81 SDR 13.5 (Schedule 40). It shall bear markings that will identify the material as that which is specified and shall carry the seal of the National Sanitation Foundation. Riser sections shall be joined by threaded flush-joint couplings, to form water-tight unions. Adhesives or solvents shall not be used to join the casing sections. The use of Teflon tape on threaded joints is acceptable and shall be noted on the well construction log. No lead shot or lead wool is to be employed in producing seals at any point in the well.

2.2.4 Well Plumbness and Alignment. All risers shall be set round, plumb, and true to line. A 10-foot long section of pipe, one-half inch less in diameter than the inner diameter of the well riser pipe, shall be run through the entire length of the well to check the alignment. The result of such test shall be recorded on the Daily Quality Control Reports and the installation diagram. If the pipe does not pass freely for the entire depth of the well, the drill crew shall replace or repair the well. The pipe section shall be decontaminated with steam prior to the test. Adequate precautions shall be taken to prevent cross-contamination of wells with cable or rope used to conduct the test.

2.2.5 Bentonite Seal. A minimum 2-foot thick bentonite seal shall be tremied into place in the annular space above the well screen and filter pack sand. The seal shall be composed of commercially manufactured sodium bentonite pellets or granules.

Bentonite pellets shall not exceed one-half inch diameter. The bentonite pellet seal shall be allowed to hydrate a minimum of 4 hours before grouting begins. If the bentonite seal is positioned above the water table, granular bentonite shall be installed in 6 inch lifts with each lift hydrated a minimum of 30 minutes between lifts before proceeding. Clean, potable water shall be added to hydrate the bentonite. After the placement of the final lift, the granular bentonite seal shall be allowed to hydrate an additional 2 hours before grouting begins.

2.2.6 Annular Seal. Cement grout shall be placed above the bentonite seal to the ground surface. The cement grout shall consist of a mixture of Portland Cement (ASTM C 150) and water in the proportion of not more than 7 gallons of approved water per bag of cement (94 pounds). Additionally, 3 percent by weight of sodium bentonite powder shall be added unless prohibited by state or local regulations. Grout shall be placed by pumping through a side discharging tremie pipe with the lower end of the tremie pipe located within 3 feet of the top of the bentonite seal. Pumping shall continue until undiluted grout flows from the boring at the ground surface.

2.2.7 Protection of Well. At all times during the progress of the work, precautions shall be taken to prevent tampering with the well or the entrance of foreign material into it. Run-off will be prevented from entering the well during construction. All wells will be required to be finished flush with the ground or pavement. Upon completion of the well, a suitable vented cap shall be installed to prevent material from entering the well. The well riser shall be surrounded by a larger diameter protective casing and set an equal distance below the ground surface into the cement grout backfill. The casing shall be installed in a manner that does not hinder access to the monitoring well for purposes of taking samples or water level measurements. The casing shall be provided with a locking cap and lock. All locks shall be brass (non-rusting) and keyed alike. Three (3) duplicate keys shall be provided, one to the Wilmington District and two to the owner. A sloped away from the well, shall be constructed around the well casing with the top outer edge at the final ground level elevation. The ground immediately surrounding the top of the well shall be sloped away from the well.

2.2.8 Monitoring Well Installation Diagrams. Suitable diagrams detailing the as-built configuration of each monitoring well shall be prepared for inclusion in the report. The diagrams shall be prepared by a qualified geologist present during all drilling operations. Two legible copies of each field well installation diagram shall be completed and sent to the Wilmington District within five days of completion of each well. The well will not be accepted by the Wilmington District before the drill logs and installation diagrams are received and approved. Information provided on all diagrams shall include but not be

limited to the following:

- 1) Project and site names, well number and the total depth of completed well.
- 2) Depth of any grouting or sealing, and the amount of cement and/or bentonite used, and the total boring depth.
- 3) Depth and type of well casing.
- 4) Static water level upon completion of the well and after well development.
- 5) Installation date or dates, and name of the driller and the geologist installing the well. Each installation diagram shall be signed by the preparer.
- 6) All pertinent construction details of monitoring wells, such as depth to and description of all backfill materials installed (such as gravel pack, bentonite, and grout); gradation of gravel pack; length, location, diameter, slot size, material (PVC, etc.), and manufacturer of well screen(s); position of centralizers; and location of any blank pipe installed in the well.
- 7) Description of surface completion, including protective steel casing, protective pipes, and concrete surface seal.
- 8) A description of any difficulties encountered during well installation.
- 9) Surveyed coordinates and elevation of top of ground and top of well riser.
- 10) A brief stratigraphic log shall be presented on the well installation diagram also, showing depths to and descriptions of major lithologic changes encountered in the well boring.

2.2.9 Temporary Capping. Any well that is to be temporarily removed from service or left incomplete due to delay in construction shall be capped with a watertight cap and equipped with a "vandal proof" cover satisfying applicable state or local regulations or recommendations.

2.2.10 Identification of Wells. A permanent corrosion resistant tag shall be affixed to the outer steel protective casing of each well which clearly identifies the well number, depth, date of installation, the U.S. Army Corps of Engineers, Wilmington District, and the adjusted top of casing elevation. The well shall also be clearly identified as a ground water monitoring well, (or

other type of well as applicable) either on the tag or by other means which must be approved by the Wilmington District. On flush finished wells, the tag shall be fixed to the inside of the cover and the outside clearly labeled as a monitoring well.

2.2.11 Well Development. Within one week after each well has been constructed, but no sooner than 48 hours after grouting is completed, the Savannah District shall develop the wells without the use of dispersing agents, acids, or explosives. The drill crew has the option of developing the well prior to placing the annular seal providing borehole stability can be maintained throughout the development and seal placement activities. This should be considered if significant settlement of the filter pack during development is anticipated. The objectives of well development are to:

(a) assure that ground water enters the well screen freely, thus yielding a representative ground-water sample and an accurate water level measurement;

b) remove all water that may have been introduced during drilling and well installation;

c) and remove very fine-grained sediment in the filter pack and nearby formation so that ground-water samples are not highly turbid and so that silting of the well does not occur.

Development shall consist of mechanical surging and bailing until little or no sediment enters the well. This shall continue for a minimum of 2 hours. Sediment that enters the well during this process shall be removed. At the end of that time, the well shall be continuously pumped using an electric submersible, or pneumatic drive positive displacement or bladder pump. Temperature, pH, specific conductivity and turbidity shall be monitored during pumping (1 reading per well volume). Pumping shall continue until these parameters have stabilized (less than 0.2 pH units or a 10 percent change for the other parameters between four consecutive readings) and the water is clear and free of fines. If these parameters have not stabilized after 4 hours of continuous pumping, then the Wilmington District shall be contacted for further direction.

2.2.11.1 Addition of Water. If the addition of water is required to facilitate surging and bailing only formation water from that well shall be used. If this is not practical due to tightness of the formation then only bailing shall be done. In all cases, the utmost care shall be taken not to collapse well screens during development activities and at least as much water as was introduced during drilling shall be removed from each well.

Approximately 1 liter of the last water withdrawn from the well during development shall be collected in a clear glass jar.

The jar shall be labeled and immediately photograph it with a 35 mm color photo. The photo shall be submitted as part of the well installation diagram. The photograph shall be a suitably back-lit close up which shows the clarity of the water. Fines remaining in the water shall not be allowed to settle out prior to taking the photograph. The depth of any sediment which collects in the bottom of the jar after the sample is allowed to settle shall be noted on the Well Installation Diagram. The nephelometric turbidity of the water shall be determined in accordance with ASTM D-1889 and shown on the final well installation diagram.

Part of well development should be the washing of the entire well cap and interior of the well casing above the water table using only water from that well. The result of this operation should be a well casing free of extraneous materials (grout, bentonite, sand, etc.). This washing should be conducted during development, not after development is completed. This washing should not be performed where free phase contaminants (i.e. petroleum products) are present.

2.2.11.2 Well Development Records. A well development form shall be prepared and completed for each monitoring well installed. The form shall be prepared by the geologist present during the well development operations. Information provided on the well development record shall include, but not be limited to the following:

- 1) Name of project and site, well identification number, and date(s).
- 2) Date, time, and elevation of the static water level and bottom of well before development.
- 3) Method used for development, to include equipment, size, type and make of bailer and/or pump used during development.
- 4) Time spent developing the well by each method, to include the typical pumping rate if a pump was used in development.
- 5) Volume and physical character of water removed, to include changes during development in clarity, color, particulates, and odor.
- 6) Volume and source of any water added to the well, and chemical analysis of the added water.
- 7) Volume and physical character of sediment removed, to include changes during development in color and odor.
- 8) Clarity of water before, during, and after

development, including a backlit photo, and depth of any sediment which settles to the bottom of the jar containing the last one liter of water withdrawn from the well during development.

9) Total depth of well and the static water level immediately after, and 24 consecutive hours after development.

10) Readings of pH, specific conductance, temperature, and turbidity taken before, during, and after development.

11) Name(s) and job title of individual(s) developing well.

12) Name and/or description of the disposal facility/area for the waters removed during development.

2.2.12 Water Source. Water for drilling, steam cleaning and other necessary field activities shall be arranged by the Savannah District and approved by the Wilmington District. Chlorine-free water shall be used if a suitable source is available. The Savannah District shall be responsible for providing any deionized water required to perform this work.

2.2.13 Monitoring Well Log Book. A log book shall be prepared by the Wilmington District for the purpose of maintaining a record of all personnel who access the monitoring wells. The notebook shall be permanently bound and have at least one page for each well and shall contain the keys to the well caps. The book shall be handed over to the facility manager at the conclusion of the field activities. The log book shall include a listing of all existing and newly installed monitoring wells on the site or installation and shall identify their location by site location and/or number and horizontal coordinates.

A warning shall be clearly visible in the log book stating the responsibility of all individuals to use any special procedures required to protect the integrity of the wells and of the data obtained from them. The log book shall also contain a detailed description of the decontamination procedures required for any equipment that enters the well. The book shall contain log pages that shall include, as a minimum, labeled columns for the date, individual's name and organization, well number, well location and purpose of activity performed (i.e. sampling, water level measurement, etc.). The book shall be organized such that additional entries and new wells can be added at a later date.

2.3 Topographic Survey. After the completion of the

monitoring wells, the drill crew will locate each of these by standard surveying methods. The surveys and the survey field book, or legible copies, will be submitted to the Wilmington District upon completion of the project.

2.4 Investigation Derived Wastes (IDW). Drill cuttings, excess sample materials, drilling fluids, and water removed from a well during installation, development, and sampling shall be disposed in accordance with applicable federal, state, and local regulations or guidance. (Reference EPA/540/G-91/009 Management of Investigation Derived Wastes During Site Inspection)

All materials generated during field activities which are segregated as potentially contaminated shall be placed in water-tight containers supplied by the Savannah District. If drums are utilized, they shall be new, DOT and EPA-approved for transport of hazardous materials. Any drum used shall be sealed, labeled, and recorded so that its contents can be identified as to material and source. At a minimum, drums shall be labeled as to type of material contained, site number and location, boring number (and depths for soils), point of contact and telephone, and date. All materials shall be segregated in separate drums (i.e. soil, water, PPE, etc.). Labelling shall be of a permanent nature, unaffected by exposure to outdoor elements for an extended period of time. Labels shall be placed on the side of the drum and positioned so as to be easily viewed when drums are staged.

All potentially contaminated IDW shall be transported to a secured centralized location, on site, at the completion of each boring, well development, or purging event or daily. Drums shall be secured on wooden pallets and shall not be stacked more than two high.

Results from laboratory analysis of soil and groundwater samples collected during the field investigation shall be utilized to further segregate contaminated and uncontaminated drummed materials. Drums containing potentially hazardous materials shall be sampled to characterize the material for off-site disposal. These analysis shall identify the potentially hazardous characteristics of the material. The Wilmington District shall utilize the analyses to prepare a waste manifest for ultimate shipment of the material to a TSD facility.

3. CHEMICAL SAMPLING PROGRAM.

The following sections present a discussion of the sampling requirements, sample collection procedures, and sample custody procedures for the initial field work at the Wilmington ARC.

3.1 Chemical Data Quality Objectives (CDQO). CDQOs are qualitative and quantitative statements specifying the level and extent of chemical data required to support decisions during

remedial activities. The CDQOs for this project are listed below.

- 1) Collect soil samples to adequately determine the extent of soil contamination
- 2) Collect groundwater samples to adequately determine the extent of groundwater contamination
- 3) Ensure data comparability through the use of standard methods and controlled systems to collect and analyze samples.
- 4) Provide analytical results of known and acceptable precision and accuracy; and with method detection limits which are lower than applicable or relevant and appropriate requirements (ARAR).
- 5) Gather data that could support an evaluation of the risks posed by the site to human health and the environment.

3.2 USACE Chemical Quality Data Management. USACE requires that Quality Control (QC) and Quality Assurance (QA) samples be collected and analyzed. These QC and QA samples include splits or replicates of field samples. QC samples help the primary laboratory to identify and diagnose problems related to sampling and analysis.

3.2.1 QA Samples. QA samples will be sent to James H. Carr and Associates, Columbia, South Carolina.

3.2.2 QC Samples. QC samples will be sent to Specialized Assays, Nashville, Tennessee.

3.2.3 Laboratory Turnaround Time. The maximum turnaround is 30 days (from receipt of samples) on all laboratory analyses of QC samples.

3.2.4 Quality Control/Quality Assurance Samples. The number of QA/QC samples to be taken is detailed in Table 1.

3.2.5 Quality Assurance Report. A quality assurance report shall be provided by the South Atlantic Division Laboratory.

Table 4. Quality Control and Quality Assurance

Matrix/ Parameter	QUALITY CONTROL SAMPLES						QUALITY ASSURANCE SAMPLES			
	# of Field Samples	# of Dups/ Splits	# of Sampler Rinsates	# of MS/ MSDs	Total QC Samples	QA Dups/ Splits	QA Sampler Rinsates	QA Trip Blanks	Total QA	
Soil/ TPH	8	1	0	0	1	1	0	0	1	
Groundwater/ VOA	7	1	0	0	1	1	0	1	2	
Groundwater/ Semivolatiles	7	1	0	0	1				0	
Groundwater/ Metals	7	1	0	0	1	1	0	0	1	

3.3 Sample Collection Procedures.

3.3.1 Soil Sampling. The following section discusses soil sampling and collection procedures at Wilmington ARC.

3.3.1.1 Locations. A total ten (14) soil samples shall be collected for chemical analysis; eight (8) primary samples for TPH; one (1) QC sample for TPH; one (1) QA sample for TPH; and four (4) samples for Asphalt Cement Extraction Test. One soil sample shall be collected for chemical analysis from the soil water interface of each shallow monitoring well boring. A second sample shall be collected from this interface only if the primary sample appears to contain asphalt. Two samples shall be collected from the deep monitoring well boring; one sample from the soil water interface of the water table aquifer; and a second sample from beneath the confining layer (if present).

3.3.1.2 Soil Sampling Procedure. Sampling for chemical analysis shall be performed using a stainless steel split-spoon sampler. Soil grab samples for total petroleum hydrocarbons shall be obtained by subsampling the material retrieved in the split spoon. Subsampling shall be done immediately upon opening the split spoon, and shall be done as soon as possible once the split-spoon sample is taken from the boring. The portion of the split-spoon sample which represents slough shall not be subsampled. The drill crew is responsible to recover adequate soil volume for all analytical requirements. If the sample volume of the first sample is not adequate, another sample shall be attempted from immediately below the previous sample or from the same depth in a boring drilled immediately adjacent to the boring in which the sample failed. The sample containers shall be filled completely leaving no headspace and then shall be placed immediately in a cooler with a temperature of 4°C.

3.3.1.3 **Sample Containers, Preservation Procedure and Holding Times.** The following table presents the requirements for the sample containers, preservation procedure and holding times.

Table 5. Total Petroleum Hydrocarbons

Matrix	Soil
Parameter	Total Petroleum Hydrocarbons
Container	1 X 8 oz. Glass w/Teflon Lined Seals
Preservation	Ice to 4° C
Max Holding Times: Extraction Analysis	within 14 days within 40 days

Table 6. Asphalt Cement Extraction

Matrix	Soil
Parameter	Asphalt Cement Extraction
Container	1 X 8 oz. Plastic
Preservation	None Required

3.3.1.4 Headspace Screening Method. The soil samples shall be screened for volatile organic compounds in the field at the time of sample collection. Field screening shall utilize an organic vapor analyzer equipped with either a photo-ionization detector (PID) or a flame-ionization detector (FID). If a high humidity condition exists during the time period when field activity is to be performed, the FID is recommended since a PID is not reliable screening instrument under these conditions. The ionization potential of lamp for the PID shall be optimum for the contaminants of concern.

1) Immediately upon opening the split-spoon (or other sample retrieval device) and after collecting the volatile organic sample (if required), a representative portion of the sample shall be collected and placed in a clean, contaminate-free jar. (The sample may be placed in a new, clean, plastic sandwich bag inside a jar to minimize the number of new jars required. **If the plastic bag method is utilized, readings shall be taken inside empty bags to ensure no external contamination is being introduced.**)

2) If the volume of sample recovered is insufficient for all analytical requirements, then the material used in the headspace readings could be utilized for any non-volatile sampling requirements (i.e. the headspace material could be used to fulfill the geotechnical requirements). NOTE: If due to insufficient sample volume a additional sample was retrieved immediately below the initial attempt, an additional headspace reading is not required.

3) Seal each jar with at least one continuous sheet of aluminum foil, using the jar lid to secure the foil.

4) Vigorously agitate the sample jar for at least fifteen seconds and then allow a minimum of ten minutes (or as the environmental conditions dictate) for the sample to adequately volatilize.

5) During cold weather the samples shall be warmed to near room temperature prior to taking the headspace measurement.

6) Re-shake the jar and then remove the jar lid. Quickly insert the vapor sampling probe through the aluminum foil and record the maximum meter response (which should be within the first two to five seconds). Erratic responses should be evaluated in terms of high organic vapor concentrations or conditions of elevated headspace moisture.

7) Record headspace screening data on the boring log and any other appropriate documentation (e.g. sample transmittals, field notebooks, etc.) as appropriate.

8) The screening instrument shall be calibrated according to the appropriate standard span gas and shall be calibrated a minimum of twice daily and before use after a long shut down period (i.e. lunch breaks, equipment breakdowns, weather caused breaks, etc.).

9) If sample jars are to be re-used in the field, jars must be cleaned according to field decontamination procedures for cleaning of sampling equipment. In addition, headspace readings must be taken to ensure no residual organic vapors exist in the cleaned sample jars.

10) Any deviation(s) from the approved procedures must be noted on the drill logs and the Daily Quality Control Report (DQCR) and a basis stated for the deviation(s).

3.3.2 Monitoring Well Sampling. The following section discusses monitoring well sampling and collection procedures at Wilmington ARC.

3.3.2.1 Locations. A total nine groundwater (9) samples shall be collected for chemical analysis; seven (7) primary samples; one (1) QC sample; and one (1) QA sample. One groundwater sample shall be collected for chemical analysis from each well.

3.3.2.2 Monitoring Well Sampling Procedures. After development, all wells shall be allowed to stabilize for a minimum of 2 weeks prior to sampling. For all wells, the depth to water and the total well depth using an electronic water level probe shall be measured and recorded. Next, the volume of the water to be purged shall be determined. Prior to purging, determine the presence of Non-Aqueous Phase Liquids (NAPLs) at the top the water column. The well shall then be pumped or bailed with clean equipment to remove a quantity of water equal to at least three times the submerged volume of the casing. Temperature, pH, specific conductivity and turbidity shall be monitored shall be measured and recorded during the purging process. Field parameters shall be measured at the start of purging and twice per casing volume removed. Purging shall continue beyond three casing volumes until these parameters have stabilized (0.2 pH units or a 10 percent change for the other parameter between four consecutive readings). If the well does not recharge fast enough to permit removing three casing volumes, the well shall be pumped or bailed dry and sampled as soon as sufficient recharge has occurred. Samples shall be drawn and placed in the appropriate sample bottles immediately upon receipt of water at the surface. The samples shall then be placed immediately in a cooler with a temperature of 4°C.

3.3.2.3 **Sample Containers, Preservation Procedure and Holding Times.** The following tables present the requirements for the sample containers, preservation procedure and holding times.

Table 7. Volatiles

Matrix	Water
Parameter	Volatiles
Container	2 X 4 mL Glass Septa vial
Preservation	4 drops con HCL or NaHSO ₄ to pH < 2, Ice to 4° C
Max Holding Times: Extraction Analysis	- within 14 days

Table 8. Metals/Lead

Matrix	Water
Parameter	Metals/Lead
Container	2 X 1 L Amber Glass
Preservation	5 ml/l of con. HNO ₃ to pH < 2, Ice to 4° C
Max Holding Times: Extraction Analysis	within 72 hours

Table 9. Semivolatiles

Matrix	Water
Parameter	Semivolatiles
Container	2 X 1 L Amber Glass
Preservation	Ice to 4° C
Max Holding Times: Extraction Analysis	within 7 days within 40 days

3.4 Decontamination Procedures. All sampling equipment will be disposable, stainless steel, or teflon and shall be decontaminated between samples. The decontamination procedures are as follows:

- 1) Alconox wash (or equal) and brushing to remove particles,
- 2) Tap water rinse,
- 3) Isopropyl alcohol, and
- 4) Triple deionized/distilled water rinse.

All decontamination water will be stored in a DOT approved drum. the drums will be labeled with a paint pen. Labeling will include site name, date, site location, and content. Once sampling is completed, decon water will be sampled with an organic vapor analyzer. If readings are less than 5 ppm, the water will be disposed in the facility oil/water separator..

3.5 Sample Handling. The following sections describe the procedures required for sample handling.

3.5.1 Numbering Scheme. Samples taken will employ the following numbering system. This system assures that a uniform and consistent numbering system is employed in the field.

pppp-ssss-nnnn

pppp = 4-character designation of the project name:

Example: **WARC** for Wilmington Army Reserve Center

ssss = 4-character designation of the sampling subsite:

Examples: MW02 for Monitoring Well No. 2
SB03 for Subsurface Soil from Boring No. 3

The following abbreviations should be used to designate the nature of each sample:

TK - Tank (UST/AST) SB - Subsurface soil
SS - Surface soil boring MW - Monitoring well
SW - Surface water SD - Sediment
SL - Sludge

Important Note: Quality Control Check samples shall not bear any designation that will identify them as such. Blanks shall be named after one of the sites sampled. (For example, the rinsate that may have been collected after MW02 was sampled could also be labelled as MW02.) Splits and Duplicates shall be named using the sample designation of the original sample. Trip blanks shall be labelled with a sample subsite designation for any of the water samples (MW02, for example).

nnnn = 4-character sequential numerical designation starting with '0001' for the first sample and incrementing by one for each subsequent sample. Each field sample should bear a unique nnnn sample number. A 'sample' may consist of more than one sample bottle in which case all bottles for a particular sample shall bear the same number.

3.5.2 Sample Labels. Correct sample labeling and the corresponding notation of the sample ID numbers in the field logbook report are necessary to prevent misidentification of samples and their eventual results. All sample labels will be completed legibly with indelible ink. The labels will be affixed to the sample bottle and covered with clear tape. These labels will include the following at a minimum:

Name of the collector,
Date and time of collection,
MRD LIMS #
Place of collection (Pope AFB, Year, Location #),
Sample ID number,
Analysis required,
Preservatives added,
Designation between "grab" and "composite" samples.

3.5.3 Sample Packaging. Sample packaging, chain-of-custody, and shipping will follow the guidelines outlined in the Sample Handling Protocol (Appendix E, ER 1110-1-263, 1 October 1990). Field samples are to be collected in appropriately labelled sample containers, enclosed within a plastic zip-lock bag, and placed in a chilled cooler. Once the samples for the day are acquired, and the required paperwork completed, the cooler will be

packed with double-bagged conventional ice and inert packing material and shipped to the laboratory.

3.5.4 Chain-of-Custody. Each cooler will have a chain-of-custody form for the samples it contains. These forms will be placed into a plastic zip-lock bag and taped to the inside of the lid. Each cooler will be securely sealed with several pieces of strapping tape attached to the front and rear sides. Custody seals will be placed on the front and rear side of the cooler lid and covered with clear tape. A sample chain-of-custody form is shown in Appendix A.

3.5.5 Sample Shipment. The laboratory shall be notified of the beginning of the sampling activities by the Wilmington District prior to the arrival of the first sample shipment. Saturday sample arrival shall be cleared with the laboratory in advance.

The primary and QC samples (**except for the Asphalt Cement Extraction samples**) will be sent via overnight delivery to:

Specialized Assays
300 12th Avenue South
Nashville, TN 37203
Telephone Number: (615) 726-0177
Point of Contact: Paul Lane

The QA samples will be sent via overnight delivery to:

James H. Carr and Associates
919 True Street
Columbia, SC 29209
Telephone Number: (803) 776-7789
Point of Contact: Pam Padgett

The samples for **Asphalt Cement Extraction** will be sent via first class mail to:

U.S. Army Corps of Engineers
Division Laboratory
611 Cobb Drive
Marietta, GA 30060-3112

3.6 Analytical Methods. The following methods will be used for analysis of the samples.

3.6.1 Soils. The soil samples shall be analyzed using the following methods;

Total petroleum hydrocarbons using EPA Method 3550/ Modified Method 8015 (California GC-FID Method),

and Asphalt Extraction Test w/ Gradation.

3.6.2 Groundwater. The groundwater samples shall be analyzed using the following methods;

Purgeable Aromatic Hydrocarbons using EPA Method 602 including Xylenes,

Semi-volatile organics using EPA Method 625 with the 10 highest peaks identified,

and Lead using Standard Method 3030C, Preliminary Treatment for Acid Extractable Metals.

3.7 Laboratory Quality Control. Quality control related to the acquisition of the chemical data has two main elements once the samples arrive at the laboratories. The first involves the documented handling of the samples as they are processed through the laboratory. The second area involves the project requirements for the method specified quality control. These two elements are discussed separately in the following two sections.

3.7.1 Sample Handling in the Laboratory. The proper handling begins with the document receipt by the laboratory of the samples from the field team. After signing the chain-of-custody, the sample receipt personnel will inspect the shipping containers and samples and document the condition in which the samples were received, and especially noting any deficiencies and note this information in the "Remarks" box of the Chain-of-Custody Form and the sample log book. For this project the laboratory will complete a Cooler Receipt form as shown in Appendix A. Information to recorded on this form will include:

- Condition of custody seals,
- Cooler temperature,
- Physical condition of samples,
- Proper labeling of sample containers,
- Completed Chain-of-Custody, and
- Chemical preservation of samples.

Following the initial receiving tasks, the samples will be logged into a hardbound handwritten notebook and also the computer data system. The data system generated work requests will be reviewed for accuracy and will be place in the proper file.

3.7.2 Method Specific Quality Control. The method of analysis specified in Section 3.6 are the standard methods that will be followed without deviation. The analytical methods have quality control requirements and/or recommendations and the laboratory will meet or exceed all method quality control as specified by the method. This included calibration procedures and frequency, laboratory quality control checks (internal standards

and surrogate spike recoveries), detection limits, corrective actions and reporting.

3.7.3 Analytical Data Report. Upon completion of the analytical work for this project the laboratory will complete an Analytical Data Report, which will include report sheets from all analyses including quality control and QA analyses and the following information. This Report will be provided to the Wilmington District in no longer than 30 days after completion of the analysis.

3.7.4 Sample Identification. A table shall identify all Field Duplicates and Field Blanks as such and match with their corresponding field samples where applicable.

3.7.5 Sample Receipt. The contract laboratory shall complete and report a "Cooler Receipt Form" for all shipments for purposes of noting problems in sample packaging, chain-of-custody, and sample preservation. This form will be shipped with the chain-of-custody form during sample shipment.

3.7.6 General Organic and Inorganic Reporting. For each analytical method run, the contract lab shall report all analytes for each sample as a detected concentration or as less than the specific limits of quantitation. Each analytical method run shall be clearly identified as belonging to a specific analytical batch. Generally, all samples with out-of-control spike recoveries being flagged for matrix interferences shall be designated as such. Appropriate data qualifiers (from Functional Guidelines) shall be used. The lab shall also report dilution factors for each sample as well as the date of extraction (if applicable) and date of analysis.

3.7.7 Internal Quality Control Reporting. A complete set of Quality Control results shall be reported for each analytical batch even if some of the QC was not performed on samples from this USACE project. The QC results shall include, but shall not be limited to, laboratory blanks, surrogate and matrix spike recoveries, laboratory duplicates and/or matrix spike duplicate pairs. At a minimum, internal quality control samples shall be analyzed at rates specified in the specific methods or higher rates if required to meet project specific Data Quality Objectives.

4. Field Documentation.

Several types of documentation will be prepared in the field to record the drilling and sampling activities. These will include boring logs, monitoring well diagrams, sample log sheets, QC/QA cover page, daily quality control reports, and a field log book.

4.1 Boring Logs. A complete and accurate drilling log for

each boring will be prepared. Each log will include name of project, hole number, location of boring, type of drill rig, size and type of bit used, diameter of boring, location and number of each sample, blow counts, types of sampling equipment, ground-water information, and description of materials. Soil materials will be classified using the USCS. Soil descriptions are to follow ASTM D 2488-84. Vapor field screening results will be recorded on the logs as well as chemical soil sampling data (time, date, depth). The drill log (copy), sample transmittals, and any other pertinent data shall be sent to the Wilmington District. A copy of the drill log is shown in Appendix A.

4.2 Monitoring Well Diagram. A monitoring well diagram shall be prepared for each well installed. A copy of the monitoring well diagram is shown in Appendix A.

4.3 Sample Log Sheets. A sample log sheet for each soil and groundwater collected for chemical analysis shall be completed at the time of collection. A copy of the sample log sheet is in Appendix A.

4.4 QA/QC Cover Page. The identity of the field-originated QC check samples is given only in the QA/QC Cover Sheet. This form is completed in the field and submitted to the QA laboratory. A copy should be kept for the project files. This form is NOT submitted to the quality control laboratory. Copies of the QA/QC Cover Pages are located in Appendix A.

4.5 Daily Quality Control Reports. A Daily Quality Control Report will be completed by the field geologist after each day's work. These reports will include information on personnel and equipment working at the site, work performed (including samples obtained), weather conditions, safety levels and equipment, quality control activities (HNU background readings, decontamination procedures, equipment calibration times). A copy of the daily control report that will be used is in Appendix A.

4.6 Field Log Book. All field observations and readings shall be recorded (in addition to the geologic logs) in a bound notebook in sufficient detail by the field geologist. This is done so that decision logic may be traced back when reviewed, or data comparison may be accomplished once off-site analytical results become available. All information shall be recorded in a bound notebook with prenumbered pages. Indelible ink will be used for all entries. A brief listing of pertinent data to be recorded in the field notebook is as follows but not limited to:

- 1) date/time
- 2) sample location
- 3) weather information

- 4) instrument calibration data
- 5) brief description of sample matrix and any visual observations
- 6) denote the number of samples obtained, ID numbers number and type of containers used, preservation used
- 7) sample shipping addresses
- 8) Federal Express billing number
- 9) any comments, remarks on field activities, and
- 10) sampler's name and initials

1.0 PROJECT DESCRIPTION

The objective of this investigation is to complete additional fieldwork for a Comprehensive Site Assessment (CSA) at the Wilmington Army Reserve Center (ARC). This document is an amendment to the Chemical Data Acquisition Plan dated March 1994. During March 1994, six monitoring wells were installed and soil and groundwater samples were collected. The locations of the wells are shown in Figure 1. Approximately seven inches of free product were discovered in MW-1-94. The specific goals of this project include determining the extent of floating product on the groundwater table and screening the storm sewers for evidence of free product.

This work effort will be performed during May 1994 by U.S. Army Corps of Engineers (USACE), Wilmington District Personnel. The description of work for this project involves the activities described below:

- 1) Prepare and submit an amendment to the Chemical Data Acquisition Plan (CDAP).
- 2) Install five temporary monitoring wells and measure the amount of floating product in each well.
- 3) Screen the storm sewers in area immediately down gradient for evidence of free product using an organic vapor analyzer (OVA).

2. FIELD INVESTIGATION.

The purpose of this field investigation at the Wilmington ARC is to define the areal and vertical extent of floating product on the groundwater table. This section of the CDAP discusses the field activities planned to accomplish this goal. The field investigation at this site can be divided into primary activities:

- * Temporary Well Borings
- * Storm Sewer Screening

The specific field activities include the installation of five (5) shallow temporary wells and screening the storm sewers using an OVA. The following sections discuss the proposed techniques for performing each of these elements.

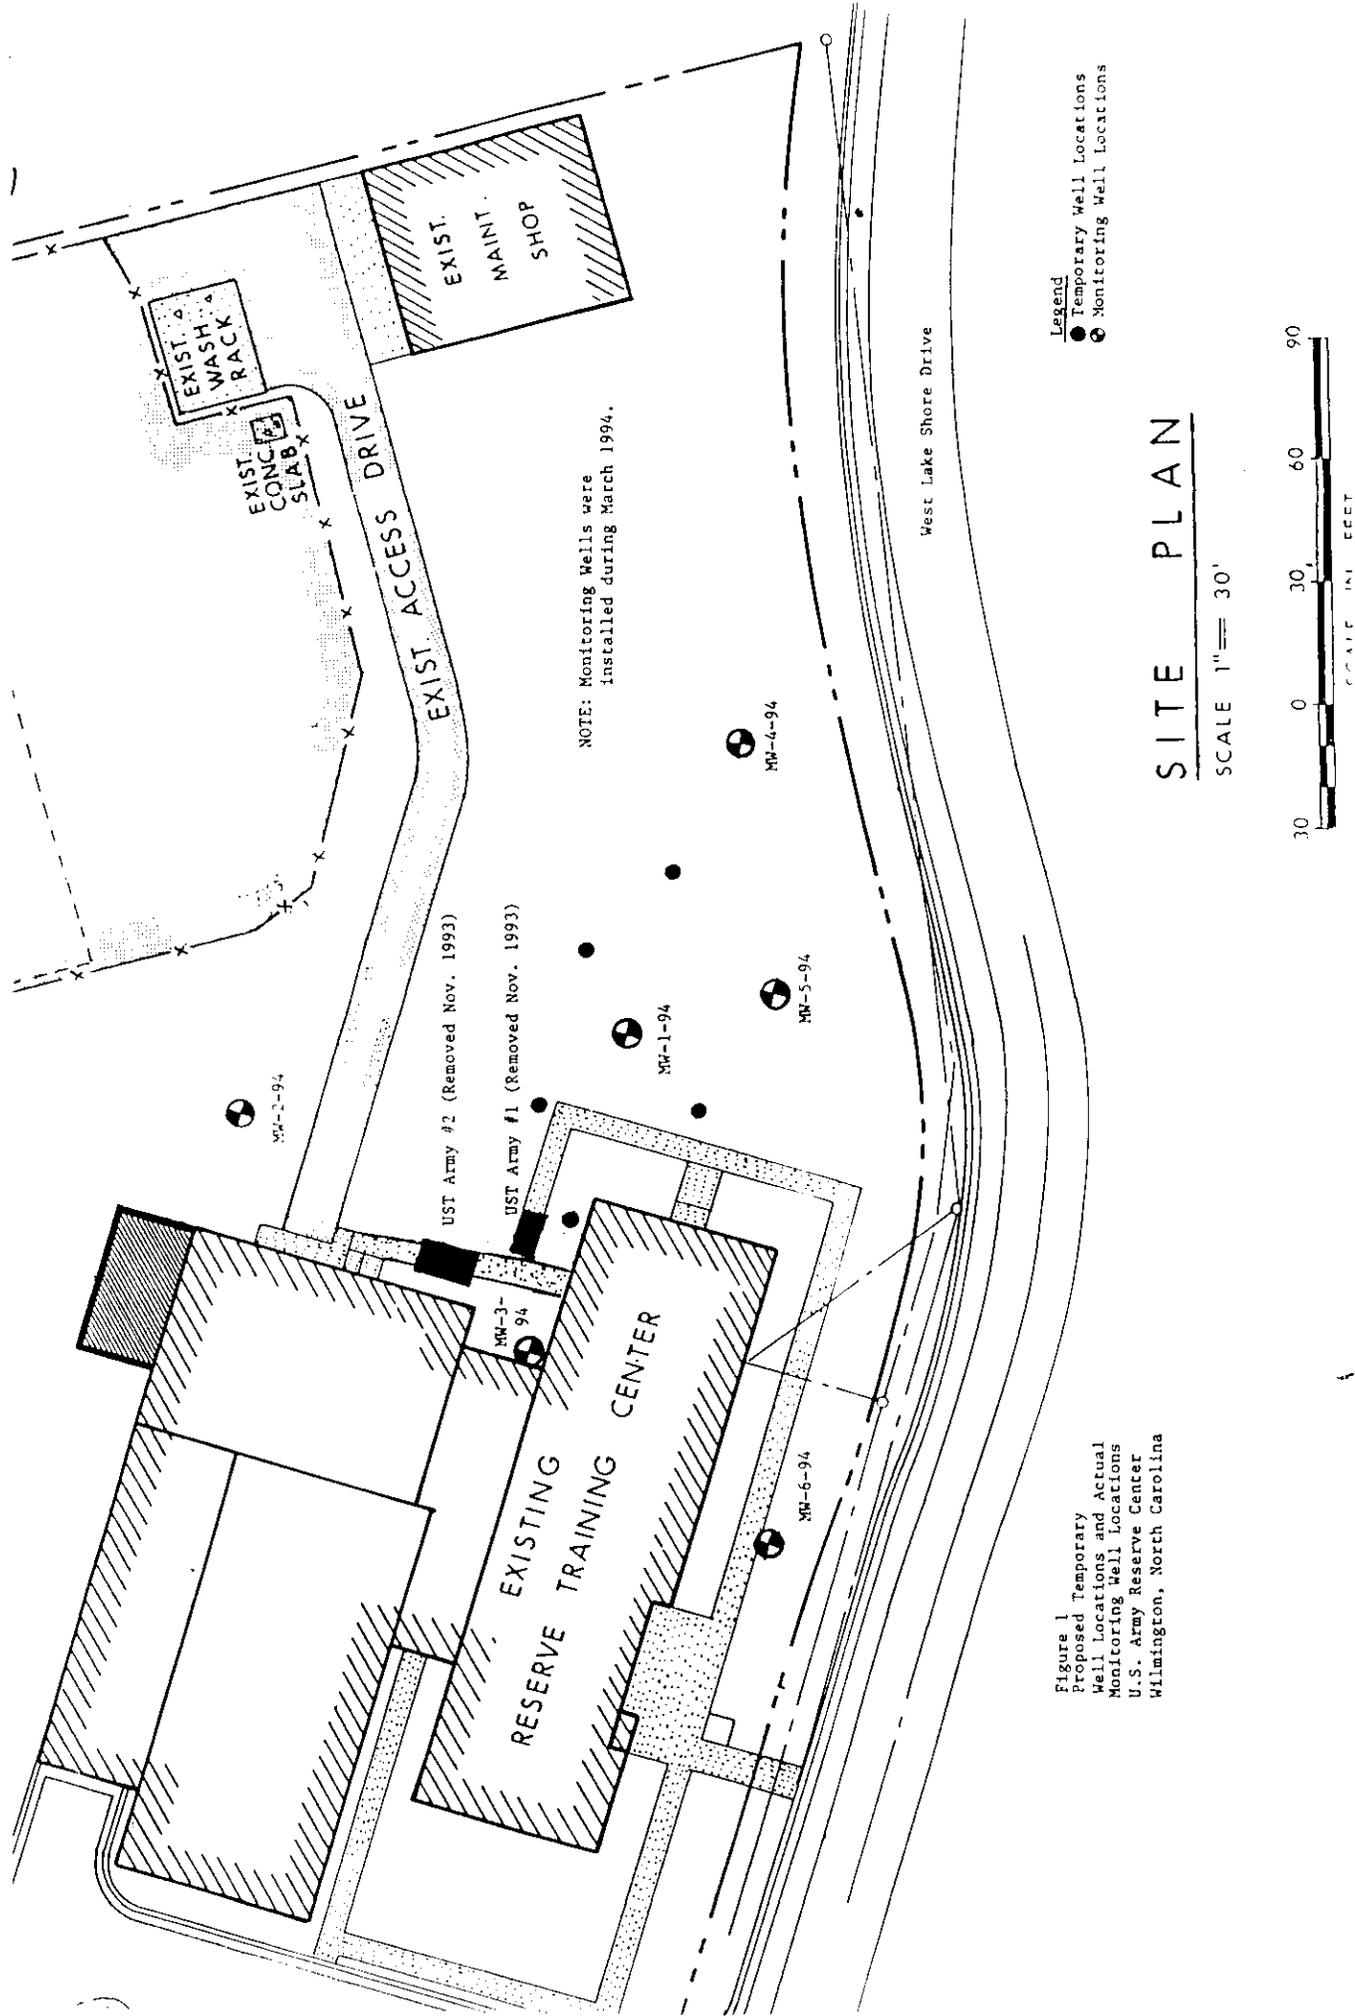

2.1 Temporary Wells. Temporary wells will be required to investigate the vertical and horizontal extent of floating product. The proposed temporary well locations are shown on Figure 1. For estimating purposes the temporary wells shall be 10 feet in depth with a 5-foot screen and 2 inches in diameter. The screen and riser shall be constructed of Schedule 40 PVC. The screen slot size shall be 0.010 inches. Field slotted screen is not permitted. The screens for the temporary wells shall be

placed as to straddle the water table.

2.1.1 Regulatory Requirements. All borings shall be drilled in accordance with all federal, state, and local requirements.

2.1.2 Drilling Methods and Decontamination. All borings shall be drilled using a power auger or a stainless steel hand auger. All drilling equipment shall be decontaminated according to Section 3.4 of the CDAP dated March 1994. Water level and free product measurements shall be made no sooner than 24 hours after installation. No soil or groundwater samples will be collected for analysis. Upon completion of the measurements, the boreholes will be grouted with neat cement grout.

2.2 Storm Sewer Screening. The storm sewers and surface water shall be screened using an OVA. Free product measurements will be made if possible.

ANALYTICAL RESULTS

TRANSMITTAL OF SAD LABORATORY REPORT(S)

TO: US Army Corps of Engineers
Wilmington District
ATTN: CESAW-EN-GS
Ms. Jan Brodmerkel
Wilmington, NC 28401

FROM: Director (CESAD-EN-FL)
SAD Laboratory
USACE
611 South Cobb Drive
Marietta, GA 30060-3112

PROJECT: Army Reserve Center

REQN NO:
CESAW-EN-GS-94-0012
W.O. NO: 7100

SUBJECT: Analytical Testing Results

1. Enclosed is our report of analytical test results and chain of custody forms for samples collected on 4 and 5 April 1994 from Wilmington Army Reserve Center.
2. If you have any questions, please call Mr. Blaise Willis at 404/421-5295 or me at 404/421-5296.

COOLER RECEIPT FORM

PROJECT: Corp of Engineers / Wilmington Army Reserve Center wa 1714 JCB 1714

COOLER RECEIVED ON: 4/5/94 AND OPENED ON 4/5/94 BY JOE LANE

Joe Lane
(SIGNATURE)

1. Temperature of Cooler when opened 110C
2. Were custody seals on outside of cooler and intact?..... YES
 - a. If YES, how many and where: 2 on each side
 - b. Were signature and date correct?..... YES
3. Were custody papers taped to lid inside cooler?..... YES
4. Were custody papers properly filled out (ink, signed, etc)?... YES
5. Did you sign custody papers in the appropriate place?..... YES
6. Did you attach shipper's packing slip to this form?..... YES
7. What kind of packing material was used?..... peanuts, bubble wrap YES
8. Was sufficient ice used (if appropriate)?..... YES
9. Were all bottles sealed in separate plastic bags?..... YES
10. Did all bottles arrive in good condition (unbroken)?..... YES
11. Were all bottle labels complete (No., date, signed, pres, etc)? YES
12. Did all bottle labels and tags agree with custody papers?..... YES
13. Were correct bottles used for the tests indicated?..... YES
14. If present, were VOA vials checked for absence of air bubbles and noted if found?..... YES
15. Was sufficient amount of sample sent in each bottle?..... YES
16. Were correct preservatives used?..... YES
17. Corrective action taken, if necessary:
 - a. Name of person contacted: _____
 - b. Date: _____

Marietta, GA 30060

Dear Mr. Willis:

The following are the results of the parameters you requested we check on your JOB# 1755 samples listed below.

Parameter	Analyst	Analysis Date -- Time		Results	Units	Lowest Detectable Level	Method Number
Sample Date: 04/05/94 In House # 04-1756-94 Source: SAD# 19653 Location: WILMINGTON							
Benzene - liquid	RMK	04/12/94	12:00	8.700	ug/l	0.50 ug/l	802.0
Chlorobenzene - liquid	RMK	04/12/94	12:00	<	5.000 ug/l	0.50 ug/l	802.0
1,2-Dichlorobenzene - liquid	RMK	04/12/94	12:00	<	5.000 ug/l	0.50 ug/l	802.0
1,3-Dichlorobenzene - liquid	RMK	04/12/94	12:00	<	5.000 ug/l	0.50 ug/l	802.0
1,4-Dichlorobenzene - liquid	RMK	04/12/94	12:00	<	5.000 ug/l	0.50 ug/l	802.0
Ethylbenzene - liquid	RMK	04/12/94	12:00	6.500	ug/l	0.50 ug/l	802.0
Toluene - liquid	RMK	04/12/94	12:00	14.000	ug/l	0.50 ug/l	802.0
Total Xylenes - liquid	RMK	04/12/94	12:00	61.000	ug/l	1.00 ug/l	802.0

Comments:

For VOC's 8020, a 1:10 dilution was made; therefore, increasing the detection time 10 times that shown.

			< 10.000	ug/l	10.00 ug/l	625.0

Comments:

The BNA run was initiated at 16:46.

BNA Analysis: The analysis of this sample showed that four of six surrogate recoveries did not meet our quality control limits. There was no more sample available for reextraction and verification of the problem. All of the other associated quality control with this sample is acceptable and for this reason the reported results should be considered valid.

Laboratory ID # 40111

Very truly yours,

DISCLAIMER

This document is provided for informational purposes only. The information contained in this document and these references represents the current view of Environmental Enterprise Group, Inc. on the issues discussed as of the date of publication.

Information provided in this document is provided 'as is' without warranty of any kind, either express or implied, including but not limited to the implied warranties of merchantability, fitness for a particular purpose and freedom from infringement. The user assumes the entire risk as to the accuracy and the use of this document.

This survey is of readily accessible areas of the building and is limited to visual observations and XRF analysis of apparent conditions/components tested and existing at the time of the survey only. Latent and concealed defects and deficiencies are excluded from the survey; equipment items and systems were not dismantled. EEG assumes no responsibility or obligation to update these findings.

Maintenance and other items may be discussed, but they are not a part of this survey. The report is not a compliance survey or certification for past or present governmental codes or regulation of any kind, unless specifically stated for that purpose. The survey and report only address the presence of or danger from the potentially harmful substance of lead in paint. The survey and report do not address the presence of or danger from other potentially harmful substances and environmental hazards including but not limited to radon, asbestos, urea formaldehyde, toxic or flammable chemicals, and water and airborne hazards. Also excluded are surveys of and report on wells, septic systems, security systems, central vacuum systems, sprinkler systems, fire and safety equipment and the presence of rodents, termites, and other insects.

This document may be copied and distributed subject to the following conditions:

1. All text must be copied without modification and all pages must be included.
2. This document may not be distributed for profit.

EXECUTIVE SUMMARY

The United States Army Reserve, 81st Regional Support Command, retained the Environmental Enterprise Group, Inc (EEG) to perform a modified lead-based paint (LBP) survey of the United States Army Reserve Center (USARC) located in Wilmington, North Carolina.

A lead inspector from EEG performed the survey using a Niton Model XL309 X-ray Fluorescence (XRF) analyzer (serial # 936) to measure the lead content of various painted surfaces throughout the building. The inspection was performed using modified guidelines of the U.S. Department of Housing and Urban Development (HUD) Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing, June 1995 and 1997. The inspector visually examined the building and grouped similar components together for survey purposes. The inspector then selected a small number of the grouped components for survey to obtain a representative characteristic analysis of similar components throughout the building. Dust and soil samples were not collected.

U.S. Environmental Protection Agency (EPA) and HUD guidelines specify a positive determination of lead in paint when the lead content is equal to or greater than 1.0 milligram of lead per square centimeter (mg/cm^2) using an XRF analyzer. A negative classification does not necessarily mean the component is lead free. The Occupational Safety and Health Administration (OSHA) Lead in Construction Standard (29 CFR 1926.62) defines lead based paint as any detectable amount and guidelines must be followed.

223 LBP readings and calibration checks were taken using the XRF analyzer. The components that contained detectable amounts of lead were the interior and exterior doors and casings, exterior painted lentils, structural steel components, and exterior metal fixtures. The results are included as Appendix A, XRF Field Data Results.

1.0 INTRODUCTION

The United States Army Reserve, 81st Regional Support Command, retained the Environmental Enterprise Group, Inc (EEG) to perform a modified lead-based paint (LBP) survey of the United States Army Reserve Center (USARC) located in Wilmington, North Carolina. Building 1, the Main Reserve Center, is a 24,500 square foot two story concrete block brick veneer building constructed in 1960. Building 2, the Maintenance Shop, is an 828 square foot brick veneer building with 2 vehicle bays. It was also constructed in 1960, but additional office space was added at a later date.

2.0 LEAD-BASED PAINT TESTING PROCEDURES

The facility was inventoried and room equivalents identified. Each room equivalent was further classified into components. The component substrate was then identified. All of these elements make up a testing combination. The following paragraphs describe the wall, room, and component description and designation:

Definition of Room Equivalent:

A room equivalent is an identifiable part of a building, such as a room, an exterior side, or an exterior area. Hallways, stairways, and exterior areas, such as loading docks, parking lots, and each side of a building, are all examples of room equivalents.

Delineation of Room Equivalent:

Each room equivalent is made up of *components*. Components may be located inside or outside a building. For example, components in a room are the ceiling, floor, walls, a door and its casing, the window sash, and window casings. The *substrate* is the material underneath the paint. Many substrates exist, however, the industry standards recommend classifying substrates into one of six substrate types: brick, concrete, drywall, metal, plaster, and wood. These substrate types are intended to include a broad range of materials. If the true substrate is not one of the six types, the substrate that most closely matches the true substrate is selected. For substrates on top of

substrates, such as plaster on concrete, the substrate directly beneath the painted surface is used. The room equivalent, component, and substrate characterize a *testing combination*. In some cases, visible color of paint may also be used to further define unique testing combinations. The *test location* is a specific area on a testing combination where the XRF instrument tests for LBP.

Exterior Structure Designations:

The exterior sides of the building are lettered, starting with the letter A. The A side of the building is the main entry side of the building. Starting on the A side, the remaining sides are lettered consecutively (B, C, D) going clockwise around the building (assuming you are viewing the building from above).

Interior Designations, Room Names, Room Sides, and Component Identification:

Unique rooms (such as halls) in the facility are named on the inspection report. If there is more than one of a certain type of named room, they are numbered. (For example, if there are three halls, they are labeled "Hall 1," "Hall 2," etc.). Other rooms, which cannot be uniquely named because the use may change, are numbered. Certain building components that are adjacent to each other and not likely to have a different painting history are grouped together in a single testing combination. Every room in the building has each of its sides lettered in accordance with the building's exterior lettering.

Sampling Strategies:

The sampling strategy adheres to the EPA Performance Characteristic Sheet for the particular XRF instrument used, as well as the manufacturer's modifications and recommendations. The XRF used for detection of LBP in these buildings was the NITON XL309 Spectrum Analyzer Lead Detector, manufactured by NITON Corporation, 74 Loomis Street, Bedford, Massachusetts 01730-0368.

Evaluation of the Quality of Inspection:

Evaluation methods include direct observation of the XRF testing, calibration checks prior to testing, periodically throughout the day, at the end of the day, and repeat testing of painted surfaces. Repeat testing entails randomly selecting and testing (in a different spot) a number of testing

combinations from previously tested areas. Usually, the XRF instrument used in the original inspection is used for retesting. The repeat results are compared with the previous results of the same testing combinations. Results should not differ from the original readings by more than the Retest Tolerance Limit, as specified in the XRF Performance Characteristic Sheet. If the difference is less than the Retest Tolerance Limit, the inspection has passed the retest. If the difference of the overall averages equals or exceeds the Retest Tolerance Limit, the procedure should be repeated with new testing combinations. If the difference of the overall averages is equal to or greater than the Retest Tolerance Limit a second time, then the inspection is considered deficient and should be re-accomplished. Appendix C includes the Quality Evaluation Results and the formula for obtaining the Retest Tolerance Limit.

3.0 IDENTIFICATION OF LEAD-BASED PAINT

Summary of Lead-Based Paint Identified in Facility:

A total 223 XRF samples and calibrations were taken throughout the buildings. The components that contained significant detectable amounts of lead were:

Buildings 1 - interior and exterior doors and casings, exterior painted lintels, structural steel components, and exterior metal fixtures.

Building 2 – exterior doors, overhead doors, frames, lintels and structural steel components

OSHA Lead in Construction Standard (29 CFR 1926.62) defines lead based paint as any detectable amount and guidelines must be followed prior to disturbing these surfaces. Appendix A contains the room-by-room results of the paint sampling conducted in the facility. Appendix B shows the floor plans.

Depth Index

The Depth Index (DI) is an indication of the amount of non-lead paint covering the lead detected by the XRF. A DI less than 1.5 indicates lead near the surface layer of paint; between 1.5 and 4 indicates moderately covered lead; and greater than 4 indicates deeply buried lead.

APPENDIX A

Lead In Paint XRF Field Data Sheets

The positive (POS) and negative (NEG) results reported on the following data sheets are based on the EPA/HUD Guidelines that specify a positive determination of lead when the lead content is greater than or equal to 1.0 mg/cm² using an XRF analyzer.

Quality Evaluation Results

Lead-Based Paint Survey Report
Quality Evaluation Results

Original XRF #	Original Result	Retest XRF#	Retest Result	Average	Squared
2019	0.2800	2021	0.2000	0.2400	0.0576
2020	0.2500	2022	0.0000	0.1250	0.0156
2044	0.0000	2045	0.0300	0.0150	0.0002
2046	0.0000	2048	0.0000	0.0000	0.0000
2054	0.0100	2055	0.0000	0.0050	0.0000
Total	0.5400		0.2300	0.3850	0.0735

Original Reading Average **0.1080**
Retest Reading Average **0.0460**
 0.0620

Absolute Difference 0.0620

$$\begin{aligned}
 C &= 0.0735 \\
 D &= 0.0735 \times 0.0072 = 0.0005 \\
 E &= 0.0005 + 0.0320 = 0.0325 \\
 F &= 0.0325 \text{ sqrt} = 0.1804 \\
 \text{Retest Tolerance Limit} &= 0.1804 \times 1.645 = 0.2967
 \end{aligned}$$

Retest Tolerance Limit = 0.2967
Absolute Difference = 0.0620

Inspection passed retest: 0.0620 < 0.2967

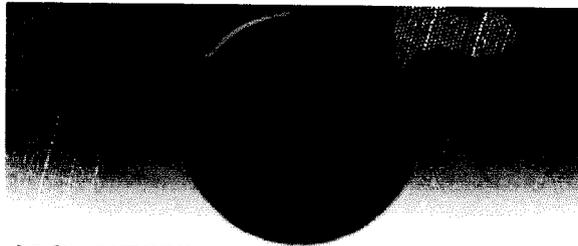

The Retest Tolerance Limit was computed using the following steps

1. Calculate the average of the original XRF result and retest XRF result for each combination.
2. Square the average of each testing combination
3. Add the ten squared averages together. This quantity is called C.
4. Multiply the number C by 0,0072. This quality is called D.
5. Add the number 0.032 to D. This quantity is called E.
6. Take the square root of E. Call this quantity F.
7. Multiply F by 1.645. The result is the Retest Tolerance Limit.
8. Find the absolute difference of the two averages.

If the absolute difference is less than the Retest Tolerance Limit, the inspection has passed retest. If the difference of the overall averages equals or exceeds the Retest Tolerance Limit, the procedure should be repeated with ten new testing combinations. If the difference of the overall averages is equal to or greater than the Retest Tolerance Limit a second time, the inspection is considered deficient. Retest Tolerance was performed in accordance with HUD/EPA Performance Characteristics Sheet for Niton XRF instruments.

Facility Manager,

Attached is the Asbestos Re-inspection Report that has been prepared for your site. The following actions should be taken to utilize the report;

1. Put attached "Re-inspection" tab and Re-inspection Report in the back the original 1998 Inspection Report binder.
2. Review all pages of the re-inspection report and make changes to the original Inspection Report and O&M Plan as noted.
3. If your site has any material that needs immediate attention, it will be listed in Paragraph 6 of the Re-inspection Notes. All materials needing immediate attention has been discussed with Michelle Hook of the 81st RSC.

Thanks for your cooperation during our site visits and if you have any questions or should need any further assistance, please contact Michelle Hook at (803) 751-6757 or me at the number below.

Mark Moltzen

US Army Reserve Center – Wilmington, NC

Asbestos Re-inspection Notes

1. Re-inspections were conducted on 4/3/02 by Mark Moltzen (NC Accreditation # 11718).
2. All references in this report, including homogeneous material numbers (H-1, H-3, etc.) and room numbers, are based on the original inspection report and Operations and Maintenance Plan prepared by the Environmental Detachment Charleston in 1998.
3. Materials listed in original inspection report were re-inspected to determine current condition & friability of the materials and new materials were listed, if applicable.
4. 7 materials were re-inspected at this site. See attached re-inspection sheets for details.
5. Original O&M Plan recommendations apply unless noted below. Note the following changes to the original inspection report and O&M plan for this site;

Building 1

H-14 Delete from O&M Report – material removed

Building 2

H-17 Delete from O&M Report – material removed

Re-inspection of Asbestos-Containing Materials (ACM)

Location of ACM (address, building, room or general description):

WILMINGTON ARMY RESERVE CENTER
2144 W. LAKESHORE DR.
WILMINGTON, NC

BLDG 1 (MAIN RESERVE CENTER)

Type of asbestos-containing material (circle):

Homogeneous Material Number: 1

- 1. Sprayed or trowelled-on surfacing material
- 2. Thermal System Insulation on piping, fittings, tanks or boilers
- ③ Miscellaneous (describe): 12" BROWN FLOOR TILE/MASTIC (ASSUMED)

Abatement Status:

1. The material has been (circle one); encapsulated enclosed **neither** removed

Material Status:

1. Current friability of ACM (circle one): Friable **Non-friable**

2. Degree of friability (circle one):
Highly Moderately Low **N/A**

3. Current condition of material (circle one):
Good Damaged Significantly Damaged

4. If material is damaged, what is approximate % of total damage N/A

5. Accessibility of the material (circle one):
Accessible & occupied Unexposed but easily accessible (i.e., behind ceiling tiles)
Accessible & unoccupied Inaccessible & not likely to expose (i.e., on roof/under floor tiles/behind walls)

6. Observations (including the condition of the encapsulant or enclosure, if any):
NONE

7. Recommended Action (circle one): **Maintain under O&M guidelines**
Repair
Remove

CESAS-EN-DG

27 October 1995

MEMORANDUM FOR RECORD:

SUBJECT: Inspection Report - Oil/Water Separator and Backflow Preventor Survey for Army Reserve Facility, 2144 Lake Shore Drive, Wilmington, North Carolina 28401-7297

1. **Time of Visit:** 26 October 1995 at 1000 Hrs.
2. **Place:** Army Reserve Facility, Wilmington, NC.
3. **Purpose of Visit:** Perform a survey to determine the condition and size of the Oil Separator at the subject facility. Survey the facility for backflow preventor and determine if backflow preventor is required at the facility.
4. **Persons Contacted and Making Inspection:** Terry Grant (910) 763-8264.
5. **Specific Matters Considered:** The oil separator required a fork lift to raise the manhole and required over an hour to remove the 38 bolts on the cover. The oil separator is a manufactured type constructed in 1994, and appears to be working well. The oil separator needs pumping out. The oil separator has no vent pipes. This oil separator is very difficult to maintain and inspect. No coalescing devices were detected in this separator.

The facility does not have a backflow preventor. Backflow preventor may be installed down stream near the water meter.
6. **Summary:** Oil separator is in need of maintenance (pumped out).
7. **Instructions Issued and Commitments Made:** None.
8. **Comments and/or Recommendations:** Recommend venting the oil/water separator. Additional questions concerning this matter should be referred to Mr. William W. Wright, EN-DG, at extension 5698.
9. **Safety Deficiencies:** The oil/water separator needs to be vented.

FIGURE 14A. Shows two 36" manhole covers one over a diversion box and the second over the oil/water separator.

FIGURE 14B. Shows diversion box with large amounts of suspended solids in the water.

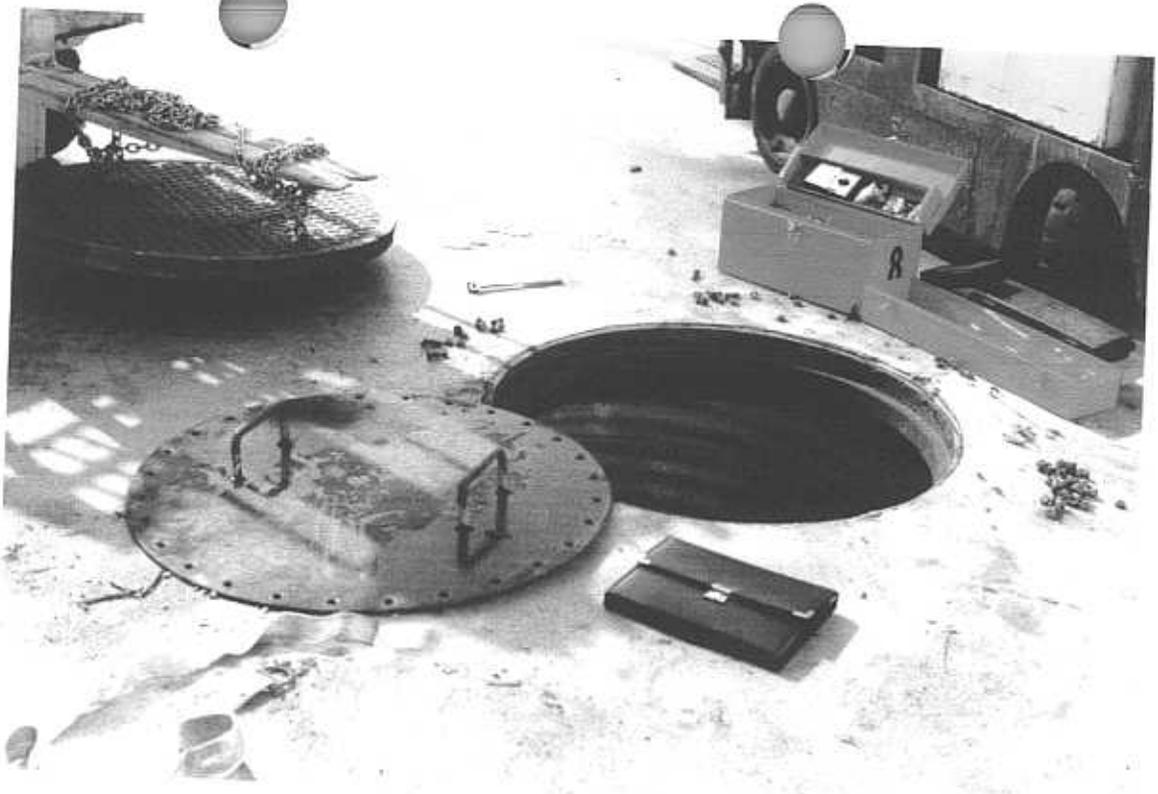

FIGURE 14C. Shows tools required to remove covers and 36 bolts to gain access into the separator.

FIGURE 14D. Shows large amounts of oil and suspended solid in the separator.

Oil / Water Separator Cleaning Report

I. General Information

A. Ownership of Oil / Water Separators (OWS)

1. Name of OWS owner:

United States Army Reserve

2. Owner address and telephone number:

*United States Army Reserve Facility
2144 Lake Shore Drive
Wilmington, NC 28401-7297
(910) 772-9591*

B. Facility Information

1. Facility name:

Wilmington Army Reserve Facility

2. Facility address, telephone number, and county:

*United States Army Reserve Facility
2144 Lake Shore Drive
Wilmington, NC 28401-7297
New Hanover
(910) 772-9591*

C. Contacts

1. Name, address, telephone number and job title of primary contact person:

*Building A-6292
2144 Lake Shore Drive
Wilmington, NC 28401-7297
Sergeant Young
(910) 772-9591*

2. Name, address, and telephone number of contractor:

*Earth Tech, Incorporated
311-J South Westgate Drive
Greensboro, NC 27407
(910) 299-9998*

D. OWS Information

Size	Type	Grit Chamber (y/n)	Oil Accumulation	Discharge Point
1421 Gallons	Open entry	No	None	POTW

E. Site Characteristics

1. Describe any past releases at this site:

There are no known past releases.

2. Is the facility active or inactive at this time? If the facility is inactive, note the last time the OWS(s) were in operation:

The site is active. The separator is used in conjunction with a military vehicle washrack.

3. Describe the surrounding property use (for example, residential, commercial, farming, (etc.):

Adjacent property is residential.

II. Cleaning Procedures

A. Describe preparations for separator cleaning:

- *On February 4, 1997, a reconnaissance was performed by Earth Tech personnel. The oil/water separator was investigated to determine if any regulated materials were present and/or any free product accumulation had occurred. Since no free product was present in the OWS, no sample was collected.*
- *Earth Tech mobilized vac truck and personnel on March 3, 1997.*
- *Earth Tech pumped residual water to the local publicly owned treatment works (POTW).*
- *The wash rack sump and separator were de-sludged by hand and material was stored in a 55-gallon 17H drum on site, pending analysis. One (1) drum of material was containerized.*
- *Drainage line from the wash rack sump to the OWS was flushed to clear accumulated debris.*
- *Drummed material (sludge) was sampled for TCLP-8 RCRA metals. Sample ID WIL-SL.*
- *Samples were sent to ETC, North Carolina state certified laboratory number 415.*

- *Drums were secured on site, manholes and grates were replaced, and Earth Tech demobilized.*
- *Sludge analysis was received on March 18, 1997 indicating non-hazardous, non-regulated material.*
- *Earth Tech, Incorporated subcontracted Soil Solutions to mobilize to the site and transport one (1) drum of non-hazardous material to their soil treatment facility in Winston-Salem, NC. The drum was removed from the site on April 18, 1997.*

B. Note the amount of residual material pumped from the OWS(s):

Approximately 6400 gallons of water was discharged to the POTW.

C. Describe the storage, sampling results, and disposal of the residual material:

Residual grit and sludge were stored in a drum on site. Water in the OWS was pumped to the local POTW. All sample results indicated non-hazardous, non-regulated materials were present in the OWS. Residual material (sludge) was taken to Soil Solutions on 1703 Vargrave Street, Winston-Salem, North Carolina 27107. Soil Solutions is a state permitted facility approved to accept and treat both regulated and non-regulated waste materials.

D. Sampling Summary:

All product and/or sludge sampling parameters indicated non-hazardous and non-regulated substances were present in the oil/water separator system. Accumulated sludge material was disposed in accordance to federal and state guidelines.

E. OWS Cleaning Results:

Upon cleaning completion, the oil/water separator system functions freely without obstruction.

SOIL SOLUTIONS

CERTIFICATE OF ACCEPTANCE

Soil Solutions, Inc. does hereby certify that 22 drums of non-hazardous hydrocarbon contaminated material were received on 4/14/97 through 4/24/97 from:

Generator: Army Reserve Centers
Originating at: Various locations in North and South Carolina
SSI Waste ID#: SF049713

This non-hazardous hydrocarbon material has been accepted by Soil Solutions, Inc. and will be remediated in their Soil Treatment Facility in Winston-Salem, North Carolina through biodegradation. Soil Solutions, Inc. guarantees the hydrocarbon contaminated material will be treated to below regulatory standards as set by the North Carolina Department of Environment, Health and Natural Resources for clean soil.

1.0 EXECUTIVE SUMMARY

Environmental Technology of North America, Inc. (ETI) was contracted by the United States Army Corps of Engineers (COE) to remove four (4) underground storage tanks (USTs) from the Wilmington Reserve Center in Wilmington, North Carolina. One (1) of the four (4) USTs are covered in this closure report. The remaining three (3) are covered in separate closure reports.

On November 16, 1993 ETI inerted, excavated, and removed a 1,000 gallon heating oil UST located near the intersection of Stadium Drive and West Lake Shore Drive (see Figures 1 & 2). Prior to removal of the UST, tank contents were identified as heating oil, and any product present was removed. Approximately 20 cubic yards of soil were removed from the excavation with a maximum depth of approximately six (6) feet. Two (2) grab soil samples were collected from the bottom of the excavation and one (1) composite soil sample was collected from the stockpiled soils. The samples were submitted to James H. Carr & Associates, Inc., a North Carolina certified laboratory, for analysis of soil for Total Petroleum Hydrocarbons (TPH) under Methods 3550 and 5030. All samples collected indicate below DEM action limit concentrations of all target parameters. The excavation pit was backfilled with excavated soils at the direction of the COE inspector.

After removal, the UST was marked according to all applicable regulations and transported to Southern Tank and Environmental, Inc., a North Carolina certified disposal facility located in Charlotte, North Carolina, where it was cleaned and cut up for scrap. The UST certificate of disposal is located in Appendix C.

The removal and disposal of the UST and its contents as well as all sampling was performed in accordance with all applicable Environmental Protection Agency (EPA) regulations (40 CFR 280), North Carolina Division of Environmental Management (DEM) requirements, and the COE contract specifications.

Because laboratory analysis confirmed that no contamination remains in the excavation, no further action should be required.

2.0 PROJECT BACKGROUND

In September of 1993, the U.S. Army Corps of Engineers Savannah District, issued delivery order number 0009 of contract number DACA21-92-D-0001 to ETI to remove four (4) USTs at the Wilmington Reserve Center in Wilmington, North Carolina. The contract is unit price based which includes all related work such as transportation and disposal of tank contents, transportation and disposal of USTs, collecting samples, transportation and disposal of contaminated

soils, backfilling excavations, site restoration, and preparation of tank abandonment/closure reports. The USTs under delivery order #0009 were heating oil tanks either 1,000 or 5,000 gallons in size.

2.1 Management Plan/Health & Safety

Prior to project commencement, both a Management Plan and a Site Specific Health and Safety Plan were prepared by ETI and approved by the US Army Corps of Engineers. In addition, all ETI personnel working on-site are current on 40 hour OSHA hazardous waste training, medical monitoring, and drug testing. Most personnel also have confined space entry training and CPR training.

2.2 Product Sampling & Disposal Procedures

Prior to removal, all USTs were sounded to determine the quantity of product present. When obtainable, the product was sampled and sent to a North Carolina certified laboratory for analysis of flashpoint utilizing EPA method 1010 to assure no hazardous constituents were present (see Appendix A). Remaining product and/or water was pumped and transported to James Waste Oil Company in Charlotte, North Carolina for disposal and/or reprocessing. James Waste Oil is a fully permitted disposal facility for such material (see Appendix B).

UST contents sampling was performed by lowering a dedicated, disposable bailer into the tank. Dedicated, disposable gloves were worn for each sample to prevent cross contamination. Bailer contents were emptied into a laboratory-grade glass container until zero head space remained. Excess contents in the bailer were emptied back into the tank. The sample container was sealed and labeled accordingly and immediately stored properly in a cooler where it was chilled to four (4) degrees celsius and transported to the designated laboratory. A chain of custody was included indicating sample number, location, time, date, and analytical parameters.

2.3 OVA Field Screening and Head Space Analysis

An organic vapor analyzer (OVA) was utilized continuously during the UST removal process to monitor ambient air quality as well as to screen excavated soils for organic vapors. When field screening indicated the presence of organic vapors in the excavated soils, those soils are staged separately from the clean soils. Headspace analyses were also performed on various excavation and/or stockpile samples to detect the presence of organic vapors.

2.4 Sampling Procedures and Analytical Parameters

Soil and groundwater samples were collected at each site in accordance with applicable Environmental Protection Agency (EPA)

regulations (40 CFR 280), North Carolina Division of Environmental Management (DEM) guidelines, and the U.S. Army Corps of Engineers (COE) contract specifications. All samples were submitted to James H. Carr & Associates, Inc., a North Carolina certified laboratory, for analysis of the required parameters. Table 1 illustrates required analytical parameters, sample media, and the North Carolina DEM action limits for contaminated soil and groundwater.

Table 1
Required Analytical Parameters and Sample Media

Soil Parameters			
Petroleum Constituent	Analytical Parameter(s)	DEM Action Limit (ppm)	Sample Media
Low Boiling Point Fuels Gasoline range	TPH (5030)	10.0	4 oz. glass jar
High Boiling Point Fuel Diesel/Heating Oil range	TPH (3550)	40.0	4 oz. glass jar
	TPH (5030)	10.0	

Groundwater Parameters			
Petroleum Constituent	Analytical Parameter(s)	DEM Action Limit	Sample Media
Low Boiling Point Fuels Gasoline range	EPA 601	2L Standard	two 40 ml vials
	EPA 602		
High Boiling Point Fuel Diesel/Heating Oil range	EPA 602	2L Standard	two 40 ml vials one amber liter
	EPA 625		

At the bottom of each tank excavation, two or three grab soil samples were collected based upon the UST length. Grab samples were collected at the most likely location of the contamination. For a tank equal to or less than twenty (20) feet long two (2) soil samples were taken; one (1) under each end of the tank, below the tank in the native (undisturbed) material. For a tank greater than twenty (20) feet long, three (3) soil samples were taken below the tank in the native (undisturbed) material; one (1) sample under each end of the tank, and one (1) in the middle of the tank. Due to safety concerns, all bottom samples were typically obtained utilizing the backhoe/tracker bucket. If groundwater was encountered in the excavation, groundwater samples were collected in lieu of soil samples.

Composite soil samples were collected from each segregated stockpile utilizing a decontaminated stainless steel four (4) inch hand auger. The number of samples collected was based upon the volume of the stockpiled soils which was estimated using the geometry of the pile and/or the excavation. Table 2 summarizes stockpile sampling requirements.

Table 2
Stockpile Sampling Requirements

Stockpile Volume (CY)	Required Samples	Comments
1 - 150	1	
151 - 300	2	
301 - 500	3	
501 - 700	4	
701 - 900	5	
901 - 1200	6	
>1200	1 per 200 CY	

Once the volume was determined, a grid was laid out that divided up the pile into square blocks with equal surface area. The number of the grid blocks was equal to the required number of samples for analysis. Each grid block was represented by at least one composite sample. Primary core samples were taken in a pattern that randomly sampled the various portions or layers of the stockpile (a portion or layer consists of a load of soil, such as from a dump truck or a backhoe bucket, which is a discreet addition to the pile). The sampling pattern took into consideration both the vertical and horizontal distribution of the portions/layers. Sample cores were distributed as evenly as practical across each grid block.

For each sample collected, dedicated, disposable gloves were worn. Soils were placed in a clean, laboratory-grade four (4) ounce glass jar and sealed. Each jar had a teflon lid, was filled with soil and lightly packed, and had a waterproof label secured to it. The jar was labeled accordingly and immediately stored properly in a cooler where it was chilled to four (4) degrees celsius by packing the cooler with ice bags and transported to the designated laboratory. A chain of custody was included indicating sample number, location, time, date, and analytical parameters. Sample numbers and locations were clearly recorded in a site log and

sketched on a scaled site map. For quality assurance and quality control (QA/QC), every tenth sample collected was split and sent to the Corps of Engineers, South Atlantic Division Lab in Marietta, Georgia. In addition, one (1) field blank and one (1) trip blank were prepared for each cooler respectively. All samples were properly packaged to prevent breakage.

2.5 UST Disposal Procedures

After removal, the UST was marked according to all applicable regulations and transported to Southern Tank and Environmental, Inc., a North Carolina certified disposal facility located in Charlotte, North Carolina, where it was cleaned and cut up for scrap. The UST certificate of disposal is located in Appendix C.

Prior to cutting or personal entry, all tanks were checked for explosive gas mixtures and oxygen content with a combustible gas indicator/oxygen meter (CGI/O₂). All readings were formally recorded and filed on-site for immediate inspection. Tanks were fully inerted and were not cut unless the lower explosive limit (LEL) was less than 10% and were not entered by personnel unless the oxygen content was between 19.5% and 22%. If the LEL reading was greater than 10%, then ETI inerted the tank by inducing air with an air compressor or with dry ice. Level C personnel protective equipment (PPE) was utilized during tank cleaning which consisted of a full-face air purifying respirator, tyvek coveralls, nitrile gloves, and rubber steel-toed boots as required by OSHA.

Once satisfactory internal gas mixtures were achieved, openings were cut on each side of the UST with an acetylene torch to provide cross ventilation for maintaining appropriate oxygen content and low explosive gas mixtures. Personnel in full Level C PPE entered the tank and removed all petroleum sludge/residue and pressure-washed the walls of the tank. Sludge/residue and pressure wash rinsate were stored on-site in 55-gallon, open-head, 17H steel drums for later disposal. Drums were clearly labeled with paint markers indicating content (i.e. mogas, diesel, waste-oil) as well as content origin (i.e. tank numbers). The remainder of the tank was then cut into approximately four (4) foot strips utilizing a pneumatic, spark-free "nibbler". Following successful demolition, formal certificates of UST destruction were completed.

2.6 Contaminated Soil Disposal Procedures

ETI has a fully permitted and operational facility in Fayetteville North Carolina, for performing bioremediation of petroleum contaminated soils (permit no, SR0600043). The facility is located at 6100 Murchison Road at the southern parameter of the Fort Bragg Military Reservation. The treatment process utilizes indigenous soil microorganisms to convert petroleum hydrocarbon compounds into carbon dioxide and water. Prior to treating contaminated soils, a

treatability study was performed to determine the baseline microorganism concentration as well as to determine what ratio of nutrients need to be added to optimize biodegradation of the petroleum constituents.

Where petroleum contamination is confirmed by laboratory analysis in the stockpiled soils, ETI formally requests approval from the North Carolina Division of Environmental Management (DEM) to move the soil from the source location on Fort Bragg to the bioremediation facility. Once DEM approval is received in writing, ETI loads and transports the soil via dump truck to the facility for processing. ETI maintains responsibility for the successful remediation of the soil.

3.0 FIELD INVESTIGATION

ETI mobilized equipment, tools, supplies, and manpower to the Wilmington Reserve Center on November 16, 1993. The scope of work was reviewed and a safety meeting was held. Meter calibration records for the organic vapor analyzer (OVA) and the combustible gas indicator (CGI) were reviewed to assure recent calibration. The UST was sounded and sampled on October 27, 1993 prior to mobilization (see Appendix A).

Prior to excavating any soils, the CGI was used to ensure that no explosive gas mixture existed within the tank. At approximately 9:30 AM, soil staging areas were set up utilizing ten (10) mil polyliner and excavation began. Excavated soils were continually screened for petroleum odors utilizing the OVA. OVA readings and visual inspections did not indicate the presence of organic vapors in the soils. Approximately 20 cubic yards of soil was removed with the maximum excavation depth approximately six (6) feet. Groundwater was not encountered.

At approximately 10:40 AM, the UST was removed from the excavation and placed immediately on a truck. The tank dimensions were recorded at 4' x 9'-10" which is approximately a 1,000 gallon tank. The tank was fiberglass and in good condition, and was labeled accordingly noting tank contents, "vapor free," UST location, and the date pulled. No holes or leaks were noted during visual inspection of the tank. In accordance with Corps of Engineer requirements, photographic documentation was maintained during the removal process. Prior to transport, the CGI was again utilized to ensure that no explosive gas mixture existed within the tank. It was then transported off-site for destruction in accordance with the procedures specified in Section 2.4 above. The certificate of disposal is found in Appendix C.

ETI collected two (2) grab soil samples from the base of the excavation and one (1) composite soil sample from the soil stockpile. Samples were collected in accordance to the procedures specified in Section 2.3 above.

4.0 LABORATORY ANALYSIS

The product sample collected was transported to AquaChem Environmental Laboratory, Inc. for analysis of flashpoint (1010). AquaChem is a North Carolina state-certified laboratory located at 11176 Downs Road, Pineville, NC 28134. Analytical results indicate below hazardous concentrations of the target analytes. The product sample laboratory transcripts are located in Appendix A.

All soil and groundwater samples collected were transported to James H. Carr & Associates, Inc. for analysis in accordance with the North Carolina Department of Environmental Management (DEM) guidelines. Carr & Associates, Inc. is a North Carolina state-certified laboratory located at 919 True Street, Columbia, SC 29290. Laboratory transcripts are located in Appendix A.

5.0 DISCUSSION

Laboratory analytical results of the samples were received from Carr & Associates, Inc. on December 7, 1993. All soil samples collected indicate below DEM action limit concentrations of all target parameters. The excavation was backfilled using excavated soils deemed clean by laboratory analysis and additional off-site backfill to fill the void once occupied by the UST.

6.0 CONCLUSIONS

The removal of the UST and its contents as well as all sampling was performed in accordance with all applicable Environmental Protection Agency (EPA) regulations (40 CFR 280), North Carolina Division of Environmental Management (DEM) guidelines, and the U.S. Army Corps of Engineers (COE) contract specifications. Laboratory analyses indicate all concentrations in the excavation and stockpiled soils are below the DEM action limit concentrations. No additional action should be required at this location.

WASTE SEGREGATION CERTIFICATION

Generator hereby certifies that the information provided above is true and correct. Generator also certifies that the used oils supplied to James Waste Oil will not be mixed, combined, or otherwise blended in any quantity with materials containing polychlorinated biphenyls (PCBs), halogenated solvents, or any other material defined as hazardous waste under 40 CFR Part 261 or applicable State regulations. Generator agrees to indemnify and hold James Waste Oil harmless for any damages, costs, attorneys and experts fees, arising out of or in any way related to a breach of any of the above certifications by Generator.

This is to certify that all non-hazardous material removed from above location has been received and will be disposed of in accordance with applicable local, state, and federal regulations in the following manner:

Petroleum products are blended into a beneficial reusable fuel for use in large industrial burners.

Waste waters are treated with polymers, pH adjusters, and a flocculant, then flows through a dissolved air flotation system for pretreatment separation before it runs through a large vacuum filter prior to discharge through the ultra-filtration unit, then into the C.M.U.D. sanitary sewer system under permit #0433.

Sludges from these treatment systems are hauled to E.P.A. approved incineration facilities for proper disposal. Manifest and certificate of disposal are on file.

Our treatment system operates on a first in, first out basis and product should be processed within seven days.

See reverse side of pink copy (owner's copy) for additional information required by N.C. - DEM in the written report and sketch.

VII. Check List

Check the activities completed.

- Contact local fire marshal
Notify DEM Regional Office before abandonment
Drain & flush piping into tank
Remove all product and residuals from tank
Excavate down to tank
Clean and inspect tank
Remove drop tube, fill pipe, gauge pipe, vapor recovery tank connections, submersible pumps and other tank fixtures.
Cap or plug all lines except the vent and fill lines.
Purge tank of all product & flammable vapors.
Cut one or more large holes in the tanks.
Backfill the area.
Date Tank(s) Permanently closed: 11-16-93
Date of Change-in-Service:

- ABANDONMENT IN PLACE
Fill tank until material overflows tank opening;
Plug or cap all openings;
Disconnect and cap or remove vent line
Solid inert material used - specify:

- REMOVAL
Create vent hole
Label tank
Dispose of tank in approved manner
Final tank destination: Southern Tank
Charlotte, NC

MEMORANDUM FOR RECORD

SUBJECT: Status of UST Closures at North and South Carolina USAR Centers

1. Albemarle, NC001. One 500-gallon heating oil UST was removed on 28 September 1994 by Environmental Technology of North America, Inc. The Closure Report was submitted to the NCDENR 27 December 1994. Heating oil USTs are not regulated in the state of North Carolina and no additional documentation from the state is available.
2. Fort Bragg, NC017 & NC054. These facilities are located adjacent to each other and all records relating to UST removal is combined. There are no records indicating a 5000-gallon UST, or two 500-gallon USTs were located at the facility. There are Closure Reports completed by Earth Tech dated 21 July 1997 for the following USTs: two 1000-gallon heating oil USTs, two 1000-gallon used oil USTs, one 1500-gallon used oil UST and two 6000-gallon diesel fuel USTs.
3. Greensboro, NC022. Documentation on various UST spreadsheets indicate a 1000-gallon heating oil UST was removed either in FY88, FY91 or FY95. Heating oil USTs are not regulated in the state of North Carolina and no additional documentation from the state is available.
4. Hickory, NC027. EnviroSpec Inc. removed a 550-gallon heating oil UST and a 1500-gallon heating oil UST on 12 December 1990. Contamination resulted from leaks in the tanks and the NCDENR issued an NOV on 15 February 1991. The final Limited Site Assessment Report, dated 13 August 1999 was submitted to NCDENR requesting a NFA finding. The NCDENR issued a NFA letter 19 November 1999.
5. Morehead City, NC033. Two 550-gallon heating oil USTs were removed by the Environmental Restoration Company. A report dated 6 January 1994 was submitted to the NCDENR. Heating oil USTs are not regulated in the state of North Carolina and no additional documentation from the state is available. At the request of Steve Francis, 81st RSC Environmental Division Chief, on 10 March 2003 I contacted Bruce Reed, NCDENR to confirm NFA was required. Mr. Reed reviewed the state's file on the Morehead City USAR Center, confirmed that the NCDENR received the UST Closure and Corrective Action Report on April 14, 1994 and stated that NFA was required by the Morehead City USAR Center or the 81st RSC.
6. Rocky Mount, NC039. Four Seasons Industrial Services, Inc. removed a 1500-gallon heating oil UST in FY90. Contamination resulted from leaks in the tanks. Remediation was completed and a Phase I Environmental Investigation Report dated March 1993 requested a NFA finding. The NCDENR issued a letter 15 July 1996 stating the site had been classified at the lowest priority level and NFA was required.

7. Wilmington, NC045. Records indicate two 1000-gallon heating oil USTs, one 2000-gallon heating oil UST and one 5000-gallon heating oil UST were removed FY93 by Environmental Technology of North America, Inc. The Closure Report indicated contamination had resulted from leaks in the tanks. Remediation was completed and a Soil Cleanup Report dated 30 September 2000 was submitted to the NCDENR requesting a finding of NFA. The NCDENR issued a finding of NFA as documented in a letter dated 6 April 2001.

8. Sunny Point, NC077. There are no records indicating there is a UST on site.

9. Columbia, SC005. Environmental Technology of North America, Inc. removed one 550-gallon heating oil UST and one 2000-gallon heating oil UST 19 October 1994. Closure Reports were submitted to the SCDHEC 27 December 1994. Contamination resulted from leaks in the tanks and the SCDHEC required remediation. Earth Tech Remediation Services removed contaminated soil and collected soil and groundwater samples. Remedial Reports, dated 2 February 1996, were submitted to SCDHEC. Based on information contained in the Remedial Report for the 1000-gallon UST, SCDHEC further required a Standard Limited Assessment (SLA) be completed. Based on data contained in the SLA, SCDHEC issued a finding of NFA in a letter dated 14 April 1997 for this site.

10. Greenville, SC015. Environmental Technology of North America, Inc. removed one 2000-gallon heating oil UST and one 5000-gallon heating oil UST 17 October 1994. Closure Reports were submitted to the SCDHEC 27 December 1994. Letter from SCDHEC dated 30 March 1995 indicates a remediation was required by the state due to leaks from the 2000-gallon tank. On 20 November 1995, Earth Tech Remediation Services removed contaminated soil and collected samples from the base of the excavation site. All target parameters analyzed from these samples were reported below detectable concentrations. The excavation was backfilled, compacted and the site was restored. The Remedial Report, dated 2 February 1996, was submitted to the SCDHEC. SCDHEC issued a finding of NFA for this site in a meeting held 21 February 1996.

11. Charleston, SC020. Environmental Technology of North America, Inc. removed one 1500-gallon heating UST 24 October 1994. Closure Reports were submitted to the SCDHEC 27 December 1994. Letter from SCDHEC dated 29 July 1995 indicates a remediation was required by the state due to leaks from the UST. On 16 November 1995, Earth Tech Remediation Services removed contaminated soil and collected samples from the base of the excavation site. The Remedial Report, dated 2 February 1996, was submitted to the SCDHEC. Based on information contained in the Remedial Report, SCDHEC further required a Standard Limited Assessment (SLA) be completed. Based on data contained in the SLA, SCDHEC issued a finding of NFA in a letter dated 14 April 1997 for this site.

12. Rock Hill, SC026. Environmental Technology of North America, Inc. removed one 1000-gallon heating UST 4 October 1994 and one 6000-gallon heating oil UST on 5

October 1994. Closure Reports were submitted to the SCDHEC 27 December 1994. Letter from SCDHEC dated 29 July 1995 indicates a remediation was required by the state due to leaks from the 1000-gallon UST. On 29 November 1995, Earth Tech Remediation Services began the removal of contaminated soil. Excavation activities continued along with sampling and backfilling of the excavation site through 28 December 1995. The Remedial Report was submitted to the SCDHEC 2 February 1996. SCDHEC required a Standard Limited Assessment (SLA) be completed. The U.S. Army Corps of Engineers Savannah District performed the SLA 26-28 June 1996 with field activities conducted 23-24 July 1996. The SLA, dated November 1996, was submitted to the SCDHEC and, based on the findings of the Tier I Assessment, requested a finding of NFA. The NFA was not granted at this time. Groundwater monitoring wells were installed as required by SCDHEC. Sampling was conducted and a final Groundwater Assessment Report, dated 20 June 2000, was submitted to SCDHEC again requesting a finding of NFA. SCDHEC issued a finding of NFA in a letter dated 7 September 2000.

13. Spartanburg, SC027. Environmental Technology of North America, Inc. removed one 1000-gallon heating oil UST 11 October 1994. The Closure Report was submitted to SCDHEC 27 December 1994. SCDHEC issued a finding of NFA in a letter dated 30 March 1995. The letter is not on file. This information is included in a "US Army Reserve UST Status" spreadsheet prepared by Natalie Macke, SCDHEC and dated 6 March 1998. Heating oil USTs are not regulated in the state of South Carolina and no additional documentation from the state is available.

14. York, SC029. On 11 May 1994, Earth Tech Remediation Services removed a 1600-gallon heating oil UST. The UST Abandonment/Closure Report was submitted to SCDHEC 24 July 1995. Heating oil USTs are not regulated in the state of South Carolina and no additional documentation from the state is available.

1.0 INTRODUCTION

This abbreviated workplan (AWP) was prepared to address the additional work required to complete the Supplementary Comprehensive Site Assessment (CSA) at an Underground Storage Tank (UST) Site at the US Army Reserve Center, Wilmington, NC located at 2144 West Lake Shore Drive. Refer to Figure 1 for the regional map. The scope of work for these additional activities is being conducted by ZAPATA ENGINEERING, P.A. on behalf of the US Army Corps of Engineers (USACE) Savannah District and the 81st Regional Support Command.

The additional work required includes the installation of one additional 2-inch groundwater monitoring well, additional sampling, the drilling of a 4-inch recovery well, completion of an aquifer pump test, and investigative-derived waste (IDW) disposal. A.E. Drilling Services, Inc. will conduct the drilling operations under direction of ZAPATA ENGINEERING, P.A.

The final workplans previously prepared for the Supplementary CSA dated 28 November 1995, will be referenced and incorporated, where applicable.

2.0 DESCRIPTION OF WORK

The additional work required includes the installation of one additional 2-inch groundwater monitoring well to fully define the horizontal extent of contamination, additional sampling of the new and existing monitoring wells on the site, the drilling of a 4-inch recovery well, completion of an aquifer pump test, and investigative-derived waste (IDW) disposal. Aquifer testing will be performed to evaluate the hydraulic characteristics of the surficial aquifer (e.g., transmissivity, storativity, and hydraulic conductivity). These parameters will then be used to develop a feasible remediation alternative for the site which will be described in the Corrective Action Plan (CAP). All additional wells advanced at the site will be surveyed by Hanover Design Services, P.A. upon completion of site activities according to Section 6.8 of the original Geologic Data Acquisition Plan (GDAP) dated 28 November 1995.

2.1 Personnel On Site

The ZAPATA ENGINEERING project representatives are:

John B. Reeves	Project Manager	(704)358-8240
Chad Grubbs	Site Manager/Geologist	(704)358-8240
Bryan Moeller	Site Geologist/SSHO	(704)358-8240
Rick Bolich, P.G.	Professional Geologist	(704)358-8240

Additional personnel include:

A&D Industrial Services	IDW Disposal	(910)434-7750
A.E. Drilling Services	Drillers	(803)288-1986
Hanover Design Services	Surveyor	(910)343-8002

2.2 Installation of the Four-Inch Recovery Well

The first task of the additional field activities is the installation of a four-inch diameter PVC recovery well (RW-1-96). RW-1-96 will be advanced between existing wells MW-9-96 and MW-10-96. Refer to Figure 2 for locations. RW-1-96 will be advanced to an approximate total depth of 30 feet below ground surface (bgs) and will be screened approximately 10 feet bgs. to 30 feet bgs. The wells total depth will be based on the location that clay and/or limestone is encountered. A 0.010 slotted PVC screen will be used in this well. Refer to Figure 4 in Section 4.0 in this AWP for the RW-1-96 well construction diagram. This four-inch recovery well will serve as the pumping well for the 24-hour aquifer pump test. This well will be flush-mounted with a 12" manhole cover and appropriately labeled. All protocols and installation practices discussed in the Geologic Data Acquisition Plan (GDAP) of the original workplans for this site dated 28 November 1995 will be incorporated during the installation of this four-inch recovery well.

2.3 Installation of the Additional Two-Inch Monitoring Well

After the installation of RW-1-96, an additional two-inch PVC monitoring well (MW-12-96) will be installed between MW-5-94 and West Lake Shore Drive to fully define the horizontal extent of the petroleum contamination in the groundwater. Refer to Figure 2 for approximate location of MW-12-96. MW-12-96 will be advanced to an approximate depth of 15 feet bgs. and will be screened from 5 to 15 feet bgs. All protocols and installation practices for a two-inch well discussed in the Geologic Data Acquisition Plan (GDAP) of the original workplans for this site dated 28 November 1995 will be incorporated during the installation of this monitoring well.

2.4 Additional Soil and Groundwater Sampling

Additional soil and groundwater samples will be collected from the two additional wells that will be advanced at the site. Soils will be continuously field screened with a Foxboro TVA-1000 Flame Ionization Detector. One soil sample per well boring will be collected for laboratory and geotechnical analysis. Soil sampling protocols and test methods will follow the procedures outlined in the original Chemical Data Acquisition Plan (CDAP) and GDAP in the workplan dated 28 November 1995. Refer to Table 1 in Section 5.0 of this AWP for the sample and analytical requirements for the additional sampling at the site.

All of the existing groundwater monitoring wells at the site (MW-1-94 through MW-11-95) will be developed and resampled using the same protocols and practices defined in the CDAP of the original workplans for this site dated 28 November 1995. If MW-1-94 contains any free product, free product in the sampling bailer shall be separated-out, so that the dissolved constituents in the groundwater can be tested. After a 48 hour recovery period, the newly installed RW-1-96 and MW-12-96 will also be purged, developed, and sampled. Before sampling, water levels, pH measurements, specific conductivity, and temperatures will be measured in all wells as outlined in the CDAP in the original workplans for the site. All wells will be sampled during one sampling event. Refer to Table 1 in Section 5.0 of this AWP for the sample and analytical requirements for the additional sampling at the site.

2.5 Step Drawdown Test

Prior to the performing the aquifer pump test, a step-drawdown test will be done to assess the optimum pumping rate for the pumping well (RW-1-96). The step-drawdown test will be performed no sooner than 48 hours after the well's construction. This will allow well development, followed by sampling, to be performed simultaneously with the step-drawdown test. A Grundfoss Redi-Flo 2 submersible pump will be used in the pumping well due to its high and variable flow rate capabilities. All IDW created during the step-drawdown test and aquifer pump test will be temporarily stored in a aluminum tanker trailer, until all pumping is complete. Totalizers will be installed between the pumping well and the tanker to determine the total amount of water removed and subsequently stored in the tanker. A permitted waste disposer will then remove the tanker and dispose of the water pending waste classification analysis results.

2.6 Aquifer Pump Test

To perform the aquifer pump test, a four-inch diameter pumping well (RW-1-96), screened from 10 to 30 feet bgs. will be installed approximately 15 feet west of MW-10-96. The well's screen length and location will allow a greater degree of drawdown in the aquifer and permit several existing monitoring wells to be used as observation wells. Monitoring wells MW-9-96 and MW-10-96 will be used as primary observation wells. Transducers will be placed in these wells to record all groundwater elevation changes electronically using a data logger. MW-3-94, MW-1-94, and other possible wells will be used as secondary wells. Their water table elevations will be recorded manually using a hand held water level meter.

The pump test will be conducted for a 24 hour period. After the 24 hour period, the pump in RW-1-96 will be shut off, and the recovery phase will begin. The recovery phase consists of monitoring the groundwater recovery in the observation wells (MW-1-94, MW-3-94, MW-9-95, MW-10-96) as well as the recovery well (RW-1-96) until the groundwater has recharged to within 20 percent of the original pre-pump test elevation. Refer to Figure 3 for the approximate equipment setup area for the aquifer pump test.

2.7 Decontamination Procedures

All decontamination procedures outlined in the GDAP in the original workplans dated 28 November 1995 will be followed during the additional site investigations at the site.

All equipment used during the aquifer pump test (i.e. transducers, data loggers, pumps, and tubing) will be decontaminated before transport to the site. The method of decontamination for this equipment will be the same as the pH meter, water level indicator, and the specific conductivity meter described on page 6-20 of the CDAP dated 28 November 1995.

2.8 Investigative-Derived Waste

The investigative-derived waste (IDW) generated from drilling the new two-inch monitoring well (MW-12-96), the four-inch recovery well, and from all sampling events will be properly contained in labeled DOT approved 55-gallon drums on pallets near their source. Labels on the drums shall include the boring/well number and content description. Other wastes, such as trash, gloves, disposable bailers, etc., shall be disposed of off-site in accordance with all applicable regulations. All additional requirements for IDW outlined in the GDAP dated 28 November 1995 will be followed.

All IDW created during the step-drawdown test and aquifer pump test will be temporarily stored in a aluminum tanker trailer until all pumping is complete. Totalizers will be installed between the pumping well and the tanker to determine the total amount of water

removed and subsequently stored in the tanker. A permitted waste disposer will then remove the tanker and dispose of the water pending waste classification analysis results.

2.9 Daily Quality Control Reports

In addition to field logbooks, the same type Daily Quality Control Report (DQCR) forms as used during previous activities will be completed on a daily basis while on-site. This form will be completed by the Site Geologist in the field at the end of each day of field work. The DQCR form summarizes the day's activities and includes information such as equipment and personnel on site, work performed, problems encountered, and activities planned for the following day. Any changes or deviations from the workplan/AWP will be documented in the DQCR. Refer to Figure 5-2 in the CDAP dated 28 November 1995 for a copy of the DQCR form.

3.0 PLAN OF OPERATIONS FOR AQUIFER PUMP TEST/STEP DRAWDOWN TEST

The purpose of the aquifer pumping test is to determine the hydraulic conductivity, transmissivity and specific yield of the water table aquifer in the vicinity of the Wilmington Army Reserve Center. Using these variables, a contaminant transport rate can be calculated to determine if natural attenuation is a viable approach for the site. In addition, the radius of influence of the groundwater, under these pumping conditions, will also be determined. This will be invaluable information, if it is determined that an active pump and treat system will be required.

The designated pumping well will be the newly installed 4-inch diameter well, identified as RW-1-96. RW-1-96 will be screened approximately 10 to 30 feet below ground surface (bgs). The well's total depth will be based on the location that clay and/or limestone is encountered. Two existing 2-inch diameter monitoring wells, MW-9-96 and MW-10-96, will be used as primary observation wells during the pumping test. Groundwater levels in wells MW-1-94 and MW-3-94 will also be monitored during the pumping test. These wells will be used as secondary observation wells.

Groundwater generated from RW-1-96 during the step drawdown and aquifer test will be discharged directly into a plastic wading pool. When the water level in the wading pool approaches its maximum capacity (approximately 200 gallons), it will be pumped into an aluminum tanker trailer with a gasoline powered centrifugal pump. All groundwater generated during the step drawdown test and aquifer pump test will be temporarily stored in this tanker trailer before being hauled off site by A&D Environmental. A&D will be notified on the same day the aquifer pump test is completed to transport the water. This will minimize the disturbance of the Army Reserve Center's day to day activities. The tanker trailer will be stored at A&D's facility pending waste classification analysis results. The plastic wading pool which was used as a temporary holding vessel will be

pumped dry at the end of the test. The bottom of the wading pool will be shredded with a knife in order to render it un-usable before being properly disposed of off-site.

One day prior to the aquifer pump test, a step-drawdown test will be performed on RW-1-96 to assess the optimum pumping rate for the aquifer pump test. Rick Bolich, P.G., Chad Grubbs, Site Manager, and Bryan Moeller, Site Geologist will perform the test. The pumping well will first be developed using a gasoline-powered centrifugal pump. Once all sediment is removed from the well, a Grundfoss Redi-Flo 2 pump will be temporarily installed in RW-1-96. RW-1-96 will be pumped at two or three different flow rates with water level measurements periodically recorded from the pumping well. These measurements will be used to estimate a drawdown rate for the different flow rates performed on the well. An optimum flow rate can then be established that will create sufficient drawdown within a 24-hour period, without pumping the well dry.

The Grundfoss Redi-Flo 2 pump will be used for both the step-drawdown test and aquifer pump test. The pump is an electric submersible unit with built-in reverse flow prevention valve, so a foot valve is unnecessary. A small quantity of water will be pumped from RW-1-96 in order to match the pump discharge rate with its controller frequency. All electrical power needed during the step test and the subsequent pumping test will be supplied through an outlet from the Army Reserve Building. Two flow totalizer meters will be used during the step drawdown test and aquifer pump test to keep track of the total amount of water removed from the pumping well and subsequently stored in the aluminum tanker. The accuracy of the meters will be verified during the step drawdown test.

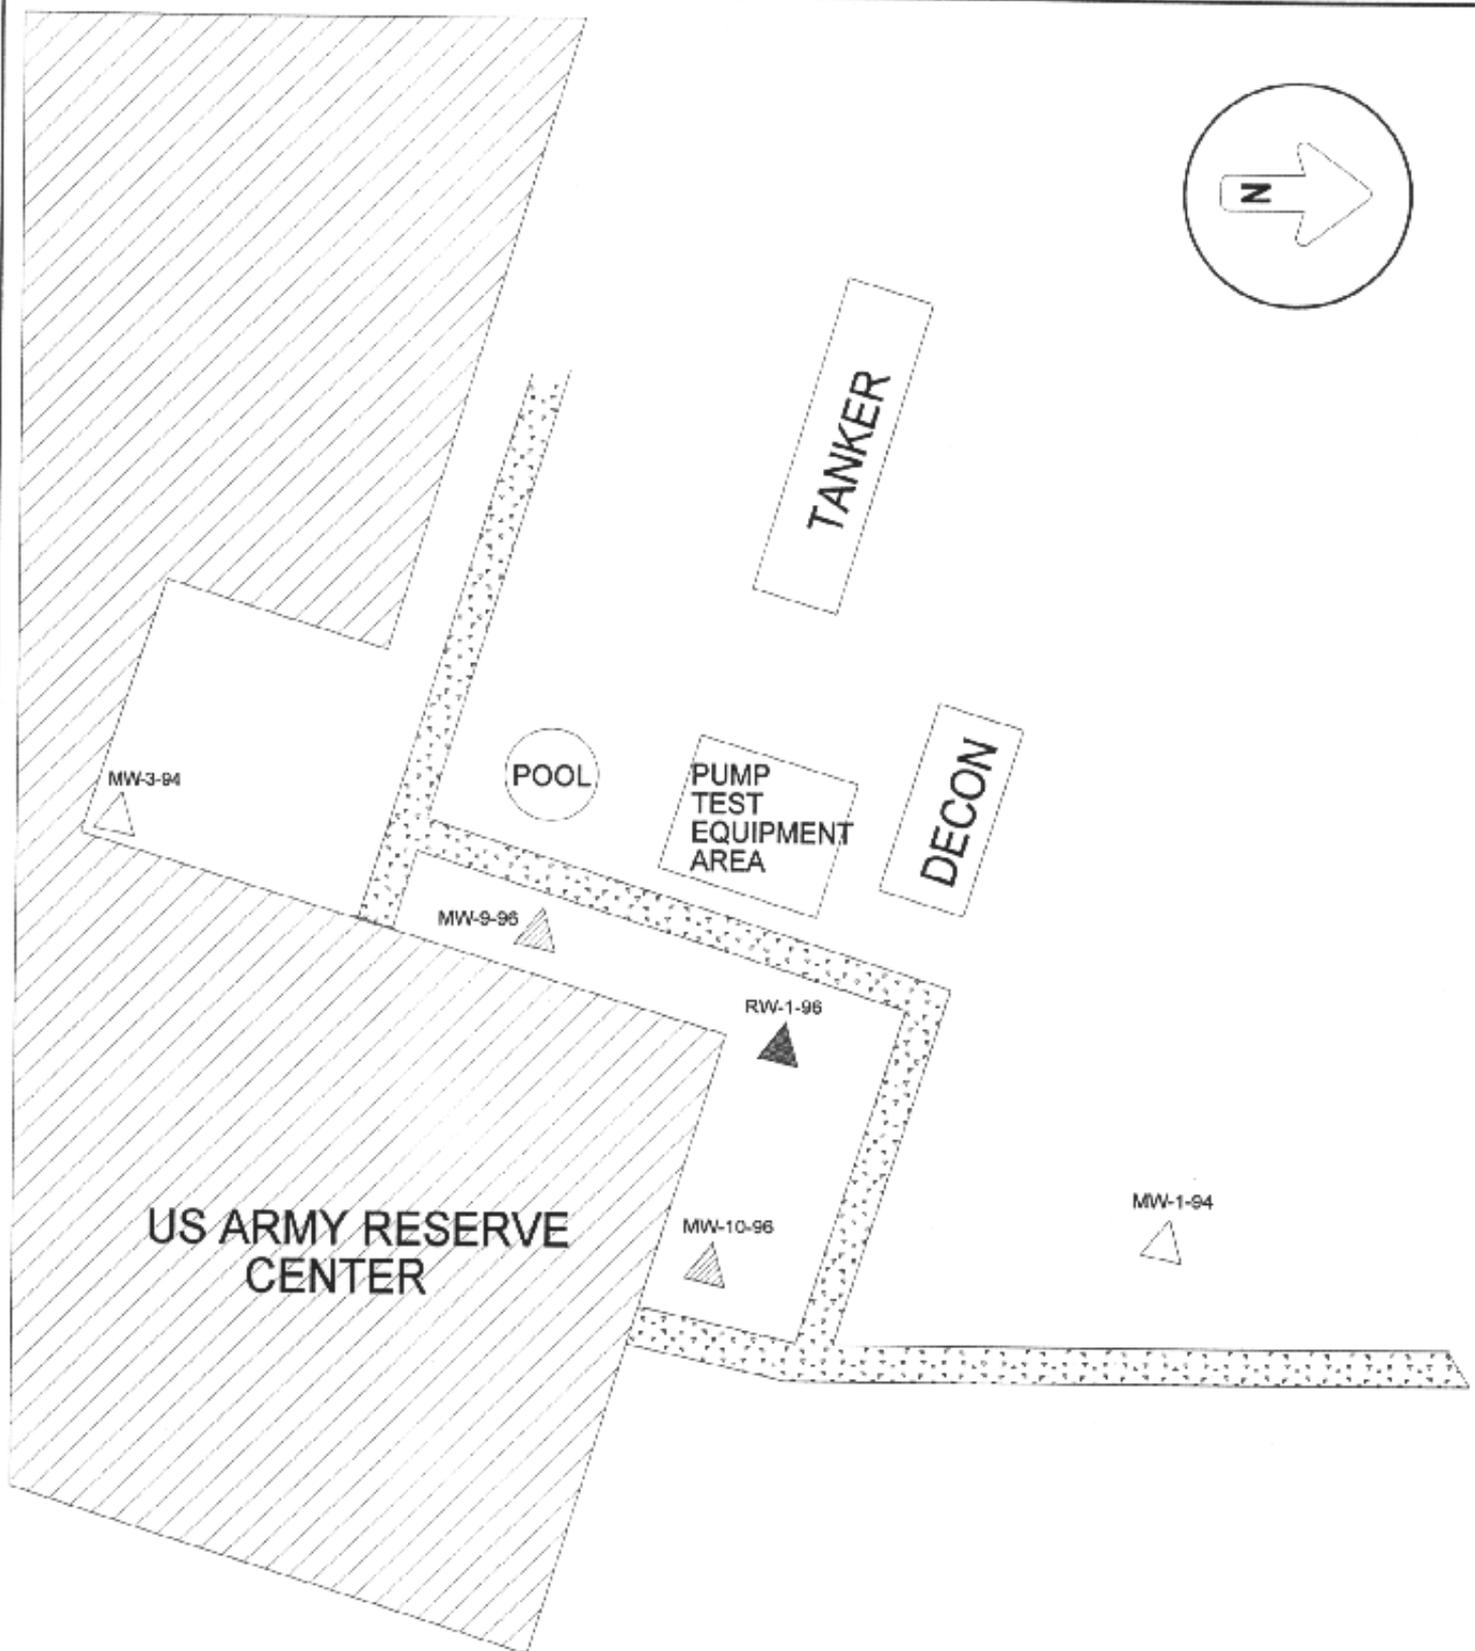

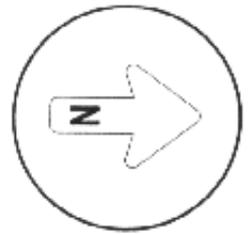

Water levels in the pumping well and the observation wells will be measured with an electronic water level probe at various times during the step drawdown and aquifer pump test. All water levels will be measured from a datum point marked on the top of the PVC well casing. A 20 pounds per square inch (psi) pressure transducer will be used to provide continuous water level data from the primary observation wells MW-9-96 and MW-10-96 during the aquifer pump test. The transducers will be placed in MW-9-96 and MW-10-96 to allow sufficient time for them to stabilize with the ambient groundwater temperature and pressure. Refer to Figure 3 for the approximate aquifer pump test setup area at the site.

On the following day, after completion of the step drawdown test, an aquifer pump test will be performed. Prior to the aquifer pump test, pre-pumping water levels will be measured and recorded in the recovery well and the observation wells approximately 30 minutes after the caps are removed. The submersible pump will be placed at a depth of approximately one foot above the bottom of RW-1-96. After initial groundwater elevations are recorded, the pump will be turned on to match the flow rate established from the step drawdown test. The pumping rate will be checked periodically during the test by timing the discharge into a graduated bucket. Adjustments to the pump speed will be made as necessary in order to maintain the established pumping rate. Water level data in MW-9-96 and MW-10-96 will be recorded using transducers at logarithmic time

intervals with an electronic data logger (In-Situ SE-1000C). The water levels will also be frequently checked with a hand-held water level indicator to verify the data from the transducers in the primary observation wells and record the water level measurements from the secondary wells and pumping well. For the first couple of hours, water level measurements will be recorded at five minute intervals. The intervals will then increase to 10, 20 and finally 30 minute intervals as water levels in the wells begin to equilibrate. When these time intervals change depends on site specific responses to groundwater drawdown.

Pumping will cease approximately 24 hours after the test began. At this time, a new logarithmic recording interval will be programmed into the data logger for the recovery phase. Water levels will be recorded from the same wells used during the drawdown phase. This phase of monitoring will continue until the water levels in the wells have recovered to within 20% of their pre-pumping levels. The pumping test equipment will then be disassembled and deconed, and the wells closed and locked.

Soon after the field work is complete, aquifer pump test and recovery phase data will be assessed after being downloaded from the data logger and checked for validity against the hand-held water level measurements. Results will be analyzed by the Neuman (1975) model that accommodates partial penetration and water table conditions. The proprietary data analysis software "AQUIX-4S" will be used to calculate values for transmissivity and storativity. Data will be matched to curves using inverse modeling (least squares regression). Finally, hydraulic conductivity estimates and the radius of influence can be determined. All drawdown data from the data logger, computer generated graphs and manual recorded water level measurements will be included with the report.

Site Map (Schematic)**

4.0 GEOLOGICAL DATA ACQUISITION PLAN ADDENDUM

The additional work required for the site assessment includes:

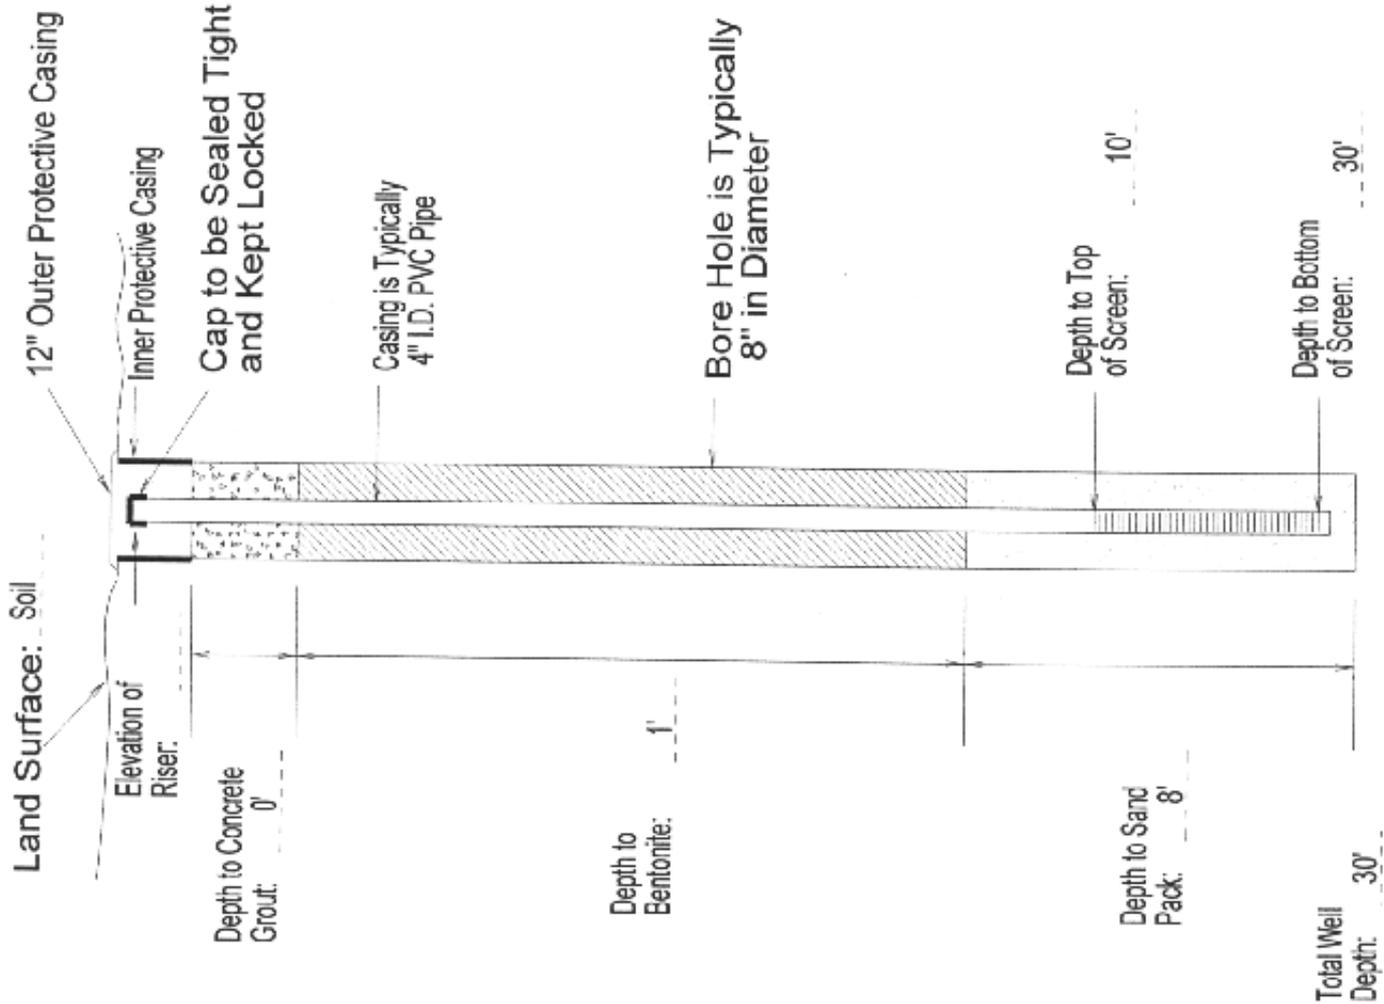

- The installation of one additional 2-inch groundwater monitoring well to fully define the horizontal extent of contamination
- Additional sampling of the new and existing monitoring wells on the site
- Drilling of a 4-inch recovery well
- Completion of an aquifer pump test
- Investigative-derived waste (IDW) disposal

All procedures and protocols outlined in the original GDAP dated 28 November 1995 will be incorporated in the additional site investigation described in Section 2.0 of this AWP. For additional information on the aquifer pump test procedures refer to Section 3.0 of this AWP. Refer to Figure 2 for the locations of the two additional wells that will be advanced at the site and the locations of the existing observation wells that will be used during the aquifer pump test. Refer to Figure 4 attached for the RW-1-96 well construction diagram. HTW Drilling logs will be prepared for each boring advanced at the site.

MONITORING WELL NUMBER: RW-1-96

Date: 4/5/96

Time: _____

Monitoring wells are used to help determine groundwater conditions. By knowing the elevation of the groundwater surface in several monitoring wells, the direction of groundwater flow can be predicted. This can be vital information when considering the transportation of substances contained in the groundwater. Another value of having a monitoring well is the capability of obtaining samples of the groundwater for laboratory analysis. As a boring is being made to establish a monitoring well, soil samples can be taken at various depths. A split spoon sampler is recommended for such sampling in order to get the least amount of disturbance.

It is vitally important to follow established procedures when constructing these wells. Proper construction will prevent the well from acting as a transporter of contaminants which might be in the soil above the groundwater. Normally a plug of bentonite is placed above the screen (area which allows groundwater to enter the well) and the soil above the groundwater elevation. Another important feature of a properly installed monitoring well is protection from possible contamination from above ground. Once a well has been established and tested, the top of the well casing should be properly sealed and kept locked. The top of monitoring wells are encased to prevent possible damage.

When the monitoring wells are no longer needed, they should be properly abandoned by placing an approved grout in the entire length of the well.

(Drawing Not To Scale)

Figure 4

5.0 CHEMICAL DATA ACQUISITION PLAN ADDENDUM

Two soil samples will be tested for Total Petroleum Hydrocarbons (TPH) Diesel Range Organics (DRO), TPH Gasoline Range Organics (GRO), and Lead. All groundwater samples (13 samples) will be tested for Volatile Organic Compounds (VOCs), Semi-Volatile Organics (SVOCs), and Lead. Test methods will be the same as those previously used during this investigation to meet North Carolina requirements. One Quality Control (QC) sample and one Quality Assurance (QA) sample will be collected for each test method and for each matrix (soil and groundwater). In addition, appropriate sampler rinsates and trip blanks will be collected and analyzed. Please refer to Table 1 for the revised sampling and analytical requirements.

All procedures and protocols outlined in the original CDAP dated 28 November 1995 will be incorporated in this additional site investigation.

A deviation from the original CDAP is the laboratory turn-around service for the sample results. Results will be expedited to no longer than 7 days. Refer to Table 1 for sample and analytical requirements for the additional site activities.

6.0 SITE SPECIFIC SAFETY AND HEALTH PLAN ADDENDUM

This addendum is for use by ZAPATA ENGINEERING personnel, subcontractors and visitors who will be working on the Supplementary Comprehensive Site Assessment and Corrective Action Plan Project at the US Army Reserve Center, Wilmington, North Carolina.

6.1 Objectives of Plan

The objective of the Site Specific Safety and Health Plan (SSHP) Addendum is to ensure the continuance of safe working conditions during the additional field activities. The SSHP dated 28 November, 1995 should be referenced and implemented in addition to the following health and safety requirements. The safety procedures outlined have been established based on a re-evaluation of the potential hazards associated with additional activities at the site. This SSHP Addendum describes the health and safety requirements and procedures to be used while conducting field work, in addition to those requirements and procedures already specified in the Final SSHP dated 28 November, 1995.

6.2 Field Activities

The modified scope of work is to install an additional two-inch groundwater monitoring well (MW-12-96), to perform additional sampling, to drill a four-inch pumping well (RW-1-96), to complete a 24-hour aquifer pump test, and to dispose of investigation-derived waste.

Table 2: Task-Specific Potential Chemical Exposure

Task Description	Potential Chemical Exposure	Hazards	Anticipated PPE Level
24-hour pump test	VOCs	respirable and absorption	D/C*
IDW disposal	VOCs	respirable and absorption	D

- * Level C PPE is required if the OVA or HNU instrumentation indicates continuous readings above half the PEL or TLV-TWA (whichever is lower) (see Table 4-1 in the Final SSHP) in the worker's breathing zone for 15 minutes or greater.
Note: If the VOC concentration exceeds 5 ppm for 15 minutes, Level C will be required.

Table 3: Physical Hazards

Task(s)	Hazard	Description	Prevention/Monitoring Techniques
24-hour pump test	Poor visibility	Night operations	Portable lights will be used to provide adequate illumination (Refer to Section 4.6.7 in the SSHP)
24-hour pump test	Ineffective communications	Night operations	A cellular phone will be used for notification and coordination of any potential site emergencies.
24-hour pump test	Blocked access/egress	Night operations	Site will be secured, however, site access/egress will not be blocked during night operations.
24-hour pump test IDW disposal	Back injury	Material handling	Personnel will not lift awkwardly-sized items. Assistance will be obtained when necessary.
24-hour pump test	Security	Night operations	Personnel shall work in teams (buddy system) during all site operations.
24-hour pump test	Electrocution	Electrical extension cords	Portable electrical tools and equipment will be double-insulated. Worn or frayed extension cords shall be replaced. All electrical wiring and equipment shall be a type listed by Underwriters Laboratories or another recognized listing agent for the specific applications. Extension cords shall not be fastened with staples, hung from nails, or suspended by bare wires.

6.3 Illumination

Portable area lights will be used to achieve illumination of at least 5 foot-candles. First aid stations must have illumination of at least 30 foot-candles. Handheld lights or headlights will be used to augment the area lighting as necessary.

page 3, MSDS - Gasoline

VII. EMPLOYER PROTECTION

VENTILATION: Maintain local or dilution ventilation to keep air concentration below 300 ppm. When loading, unloading, tank gauging, etc., remain upwind.

RESPIRATORY PROTECTION: None needed under normal conditions with adequate ventilation. Use NIOSH/MSHA approved respirator when vapor levels exceed exposure limits. Up to 1000 ppm, half-mask organic vapor respirator. Up to 5000 ppm, full-face organic vapor respirator or full-faced supplied air respirator. Greater than 5000 ppm, fire fighting, or unknown concentration, self-contained breathing apparatus with positive pressure.

PROTECTIVE CLOTHING - EYES: Chemical goggles with side shields, face shield.

PROTECTIVE CLOTHING - SKIN: Avoid prolonged and/or repeated skin contact. If conditions or frequency of use make contact significant, gloves, apron, boots and facial protection made of nitrile, neoprene or other material resistant to gasoline should be worn.

OTHER PROTECTIVE EQUIPMENT: Use electrical grounding on handling/transportation equipment.

VIII. TRANSPORTATION, HANDLING, AND STORAGE INFORMATION

DOT HAZARDOUS MATERIAL: Yes
DOT SHIPPING NAME AND NUMBER: Gasoline, UN 1203
DOT HAZARD CLASS: Flammable liquid
HAZARDOUS MATERIAL CODE: #1203

HANDLING PRECAUTIONS: Keep away from heat, sparks and open flame! Ground all drums and transfer vessels when handling. Empty containers retain some liquid/vapor residues; hazard precautions must be observed when handling empties. Refer to 49 CFR 173.118 and 173.119 (a) for packaging references.

STORAGE PRECAUTIONS: Keep containers closed and do not store in a closed vehicle. Containers should be able to withstand pressures expected from warming or cooling in storage. Do not store with strong acids or strong oxidizers. Store as an OSHA Class 1B flammable liquid.

IX. ENVIRONMENTAL PROTECTION

SPILLS, LEAKS, OR RELEASE: Notify emergency response personnel. Evacuate area and remove ignition sources. Build a dike to contain flow. Remove free liquid, do not flush into sewer or open water. Blanket with foam or use water fog to disperse vapors. Pick up with pads and absorbent materials. Gasoline will float on water and resulting runoff may create an explosion or fire hazard. Comply with all applicable laws. Spills may need to be reported to the National Response Center (800) 424-8802.

page 2, MSDS - Gasoline

IV. FIRE PROTECTION INFORMATION

FLASH POINT AND METHOD: Estimated -45°F (Closed Cup ASTM D-56)

AUTOIGNITION TEMPERATURE: 536°F or higher

EXTINGUISHING MEDIA: Carbon dioxide, dry chemical, or foam. Water stream may spread fire; use water spray only to cool containers exposed to fire. If leak or spill has not ignited, use water spray to disperse the vapors.

HAZARDOUS DECOMPOSITION PRODUCTS: Incomplete combustion can yield carbon monoxide, carbon dioxide, lead oxide and various hydrocarbons.

FIRE AND EXPLOSION HAZARDS: Can form flammable mixtures with air and flash at room temperatures. Explosion hazard in fire situation. Vapor is heavier than air and may travel considerable distance to a source of ignition and flash back.

HAZARDOUS POLYMERIZATION: Will not occur. **STABILITY:** Stable. **CONDITIONS TO AVOID:** Heat, sparks, flame, and static electricity.

VI. FIRST AID PROCEDURES

INHALATION: - Immediately move personnel to area of fresh air. For respiratory distress, give air, oxygen, or administer CPR (cardiopulmonary resuscitation). If necessary, obtain medical attention of breathing difficulties continue.

EYE CONTACT: Immediately flush eyes with clean, low-pressure water for at least 15 minutes, occasionally lifting lower and upper lids. If irritation persists, obtain medical attention.

SKIN CONTACT: If clothing is soaked, immediately remove clothing and wash affected skin with soap and water. If irritation persists, seek medical attention. Launder clothing before reuse, but discard contaminated leather shoes/gloves.

INGESTION: DO NOT induce vomiting, since aspiration into the lungs will cause chemical pneumonia. Promptly obtain medical attention.

GENERAL: Personnel with pre-existing skin disorders, impaired liver or kidney function, or central nervous system and chronic respiratory diseases should avoid exposure to this material.

page 4, MSDS - Gasoline

WASTE DISPOSAL METHOD: Maximize product recovery for reuse or recycling. Unused liquid product is likely an EPA "Ignitable Hazardous Waste" (D001) unless proven otherwise. RCRA Classification for unadulterated product as a waste - Ignitable, EP toxic. Use approved treatment, transporters, and disposal sites in compliance with all laws. If spill is introduced into a wastewater system, the chemical and biological oxygen demand will likely increase. Spill material is biodegradable if gradually exposed to microorganisms. A potential disposal method is incineration and land disposal, if permitted.

PROFESSIONAL REVIEW

This Soil Cleanup Report was prepared by an employee of the U.S. Army Corps of Engineers, Savannah District, who is a registered Professional Engineer. This project document is signed and sealed within the scope of their employment as required by U.S. Army Corps of Engineers, Engineer Regulation number 1110-1-8152, dated 1 December 1994.

Steven M. Bath, P.E.

Executive Summary

In 1993, Environmental Technology of North America, Incorporated removed four underground storage tanks (USTs) which had contained heating oil for the facility. The removal of these USTs was documented in three closure reports previously submitted to the State. A 2000-gallon tank contained a small hole and had leaked an undetermined amount of heating oil. During the tank removal, 33 cubic yards of contaminated soil were removed and replaced with clean fill. Both soil and ground-water samples collected at that time indicated contamination at levels exceeding North Carolina action levels.

In 1994, the U.S. Army Corps of Engineers, Wilmington District conducted a site assessment of the U.S. Army Reserve Center, Wilmington site. Volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) were detected in the soil and ground water. On 23 January 1995, a Notice of Violation of 15A NCAC 2L Groundwater Standards was issued by the State of North Carolina Department of Environment, Health, and Natural Resources (NCDEHNR). On 23 February 1995, a Site Assessment Report was submitted to the State. A Supplementary Comprehensive Site Assessment (CSA) and Corrective Action Plan (CAP) were submitted to the State in June 1996.

Initial site assessment soil samples collected from one deep and six shallow soil borings were analyzed for Total Petroleum Hydrocarbons (TPH) diesel range organics (DRO). The maximum concentration detected was 133 ppm TPH. Twelve additional borings were completed during a supplemental assessment. Maximum contaminant concentrations were 9,800 ppm DRO and 200 ppm gasoline range organics (GRO). Soil contamination is at an approximate depth of 4-6 feet below ground surface (BGS) in the capillary fringe above the water table. Target cleanup levels for the contaminated soil are based on the NCDENR Site Sensitivity Evaluation (SSE) which calculated levels of 60 ppm for GRO and 240 ppm for DRO.

Eleven shallow wells and one deeper well were installed during the site assessment phases. Free product was detected in one monitoring well, MW-1-94. Ground-water samples were analyzed using EPA Methods 602 (VOC), 625 (SVOC) and 7421/3030C (lead). Laboratory results indicate maximum contaminant levels of 180 ppb Naphthalene, 22 ppb Bis (2-Ethylhexyl) phthalate, and Ethylbenzene at 32 ppb. It was determined that the ground-water plume extended approximately 120 feet across the site but did not leave the reserve property.

The majority of the petroleum contaminated soil excavated was located at a depth interval of 4 to 7 feet BGS. Soil above this zone was both visually examined and field screened with an Organic Vapor Analyzer (OVA). Approximately 300 cubic yards of clean soil were excavated and stockpiled on site. Over 500 cubic yards of contaminated soil were excavated and removed from the site.

In August 2000, a sampling team from the Corps of Engineers, Savannah District mobilized to the site to conduct post remediation sampling. The purpose of the investigation was to ensure all of the petroleum contaminated soil above State action levels had been removed. Five borings were hand augered around the perimeter of the soil excavation. Soil samples were collected from a depth of 5.5-6.0 feet BGS. Samples were analyzed using EPA Methods 8260 and 8270, MADEP VPH: Alkanes /Aromatics and MADEP EPH: Alkanes /Aromatics. Seven monitoring wells were sampled and analyzed using EPA Methods 602 and 8270, MADEP VPH: Alkanes /Aromatics and MADEP EPH: Alkanes /Aromatics.

Results of the laboratory analyses indicate the soil samples contain no chemicals of concern related to the site. No free product was detected in any of the monitoring wells on the site. Results for the post remediation ground-water sampling indicate low levels of petroleum contamination are still present in five of the seven wells sampled. When compared with monitoring well data from previous ground-water sampling events, it is evident that contamination levels are continuing to decrease. In accordance with State regulations, the contaminated soil on the site has been removed to the required standards. It is hereby requested that the Department of Environment, Health, and Natural Resources issue a notice specifying that no further action is required for this site.

Evaluation of Remediation Alternatives

Zapata Engineering, P.A. completed a Corrective Action Plan (CAP) which was submitted to the State in June 1996. Several alternatives for the remediation of ground water were evaluated, including: air sparging/ vapor extraction, ground-water extraction/ air stripping and monitored natural attenuation. Excavation/ removal, soil vapor extraction and bioventing were considered for remediation of the contaminated soil.

Air Sparging and soil vapor extraction were considered as a combination technology simultaneously remediating the soil and ground water. This technique requires the contaminants to be volatile. The heating oil constituents at this site are mostly semi-volatile and would not lend themselves to rapid remediation through this method. The injection and extraction of air into the subsurface would promote biodegradation of the contaminants. However, design of a bioventing system would not be economical for such a small area of contamination.

Ground-water extraction with air stripping, or pump and treat as it is commonly called, is not an efficient way to treat ground water. It is useful in controlling the direction of contaminant migration. At the Wilmington Reserve Center there is no evidence of contamination leaving the property at levels exceeding the State required cleanup levels. Since there are no receptors being threatened by contamination, the high cost of this method is unnecessary.

The remedial alternative selected was the removal and disposal of soil contaminated above the final site cleanup limits. This alternative was selected because it could be done quickly, without interfering with the operations at the Reserve Center, and because it was estimated to be the most cost effective. The soil excavation was approximately 90 feet by 45 feet and extended down to a depth of seven feet. Any free product remaining would be removed with the soil. With this secondary source of contamination removed, the ground-water contamination will continue to attenuate naturally. The CAP also recommended ground-water sampling for a period of one year to ensure the effectiveness of natural attenuation.

For a more detailed description of the remedial alternatives considered please refer to the Corrective Action Plan, June 1996, previously submitted to the State.

Site Remediation

Earth Tech, under contract to the Corps of Engineers, mobilized to the Reserve Center Site in February 1997. The contract originally called for the excavation of 800 cubic yards of soil with the removal of soil excavated from 3 to 7 feet below ground surface. The lateral extent of the excavation is shown on Figure 2. As soil was excavated down to 3 feet it was both visually examined and field screened with an Organic Vapor Analyzer (OVA). Approximately 300 cubic yards of clean soil were excavated and stockpiled on site. Excavated soil that screened as contaminated was loaded onto trucks and hauled to Carlisle Farms Inc. in Autryville, North Carolina. Soil was removed to below the water table, 7 feet below ground surface. Due to limited free space on the site, excavating and backfilling were done in strips. Confirmatory soil samples were collected below the water table with a drill rig after completion of backfilling.

During the excavation, it was determined that the quantity of contaminated soil was more than the original estimate. The contract was modified and in December 1997, an additional 100 cubic yards of contaminated soil was excavated and hauled to Carlisle Farms. The excavation was backfilled with clean soil. No soil samples were collected from the excavation side walls and the samples collected from the excavation bottom were collected below the water table.

Monitoring well MW-1-94 was within the area excavated. It was properly abandoned and replaced with a new well after completion of the removal action. Neither the Reserve Support Group nor the Corps of Engineers has a final copy of the Petroleum Contaminated Soil Removal Report.

Post-Remediation Sampling

In August 2000, a sampling team from the Corps of Engineers, Savannah District mobilized to the site to conduct post remediation sampling. The purpose of the investigation was to ensure all of the petroleum contaminated soil above State action levels had been removed. Five borings were hand augered around the perimeter of the soil excavation. For locations of soil samples see Figure 1. Soil samples were collected from a depth of 5.5-6.0 feet BGS. Samples were analyzed using EPA Methods 8260 and 8270, MADEP VPH: Alkanes /Aromatics and MADEP EPH: Alkanes /Aromatics. A duplicate sample was also collected for quality control purposes. All samples were preserved and placed on ice immediately after collection. Each sample was given its own identification number, which was recorded, in the field notes and on the chain of custody. Samples were shipped overnight to Test America laboratory to allow sufficient time to meet the required holding times. All soil sampling data were recorded in a field book and on the Soil Field Data Logs. The Soil Field Data Logs are included in Appendix A, Field Data.

Results of the laboratory analyses indicate the soil samples contain no chemicals of concern with the exception of methylene chloride, which was detected in three samples and the duplicate sample. Methylene chloride is most likely a laboratory artifact and is not present on the site. Due to the limited number of soil samples collected, it is impossible to say that all of the petroleum-contaminated soil was removed from the site during the earlier corrective action. However, based on the results of this investigation, it appears that all of the accessible contamination has been removed. The results of the laboratory analyses are summarized in Table 1 below and the laboratory analytical data is included in Appendix B, Analytical Data.

Past ground-water data was reviewed and monitoring wells which had not previously shown any ground-water contamination were not sampled during this event. Monitoring well locations are shown on Figure 2. Depth to ground water was measured in all of the wells for the purpose of developing a ground-water potentiometric map (Figure 3). Monitoring well and ground-water elevations are recorded in Table 2 below. Prior to sampling, the monitoring wells were purged to ensure a representative ground-water sample. Temperature measurements and pH were taken and recorded before, during (at least twice), and after purging. Wells were purged until these standard field measurements stabilized within 5%. At a minimum, three well volumes were removed. The following seven monitoring wells were sampled: MW-1-94, MW-3-94, MW-5-94, MW-8-96, MW-9-96, MW-10-96, and MW-12-96. A duplicate sample was also collected for quality control purposes. Ground-water samples were analyzed using EPA Methods 602 and 8270, MADEP VPH: Alkanes /Aromatics and MADEP EPH: Alkanes /Aromatics. All samples were preserved and placed on ice immediately after collection. Each sample was given its own identification number, which was recorded in the field notes and on the chain of custody. Samples were shipped overnight to the analytical laboratory to allow sufficient time to meet the required holding times. All ground-water purging and sampling data were recorded in a field book and on the Ground-Water Field Data Logs. The Ground-Water Field Data Logs are included in Appendix A, Field Data.

No free product was detected in any of the monitoring wells on the site. Results for the post remediation ground-water sampling indicate low levels of petroleum contamination are still present in five of the seven wells sampled. Petroleum Aromatic Carbon Fractions in the range of C9-C32 were detected above the ground-water standards in wells MW-1, MW-3, MW-8, and MW-10. The results of the laboratory analyses for the MADEP Methods are summarized in Table 3. The same four monitoring wells contained individual analytes above the ground-water standards. Analytes detected include 2-methylnaphthalene, 3- and 4-methylphenol, naphthalene, ethylbenzene, toluene, and xylenes. Ground-water isoconcentration maps for 2-methylnaphthalene and naphthalene are included as Figure 4 and Figure 5. The ground-water samples from monitoring wells MW-5 and MW-12 were below detection limits for all Method 602 and Method 8270 analytes. The results of laboratory Methods 602 and 8270 are summarized in Table 4. The laboratory analytical data is included in Appendix B, Analytical Data.

When compared with monitoring well data from previous ground-water sampling events, it is evident that contamination levels are continuing to decrease. Table 5 compares results from this round of sampling with previous sampling results. With the soil contamination removed, the ground-water plume will continue to decrease in size as the contaminants attenuate naturally.

Conclusions and Petition for Site Closure

Results of this site investigation did not indicate any soil contamination remaining on the site. No free product was detected in any of the monitoring wells. Ground-water samples collected and analyzed show the ground-water plume is attenuating naturally. Based on previous site investigations, the State of North Carolina has ranked the site as 60E. In accordance with State regulations, the contaminated soil on the site has been removed to the required standards. It is hereby requested that the Department of Environment, Health, and Natural Resources issue a notice specifying that no further action is required for this site.

The following samples were received on 8/23/00. These samples relate to your project: 000252 WILMINGTON RESERVE CNTR. The laboratory project number is 204844.

Sample Identification	Lab Number	Collection Date
WR-SB-1-00	00-A118535	8/22/00
WR-SB-DUP-00	00-A118536	8/22/00
WR-SB-2-00	00-A118537	8/22/00
WR-SB-3-00	00-A118538	8/22/00
WR-SB-4-00	00-A118539	8/22/00
WR-SB-5-00	00-A118540	8/22/00

Quality Control Summary:

Semi-volatile (82700) LCS within QC limits except for Benzo(ghi) and Hexachlorobutadiene, which are slightly outside QC limits. The data was not effected.

I certify that the data presented in this report are, to the best of my knowledge, accurate and complete.

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures REQUIRED by the EPA/SP8 method(s) were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael M. Dunn, M.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Laboratory Certification Number: 387

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures REQUIRED by the EPA/EPA methods were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael H. Dunn, M.S., Technical Dir.
Eric Smith, ASAC, Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Laboratory Certification Number: 387

ANALYTICAL REPORT

USACE-SAVANNAH DISTRICT 8995
MARK HARVISON
100 WEST ORLETHORPE AVE
SAVANNAH, GA 31402

Lab Number: 00-A118537
Sample ID: WR-5B-2-GO
Sample Type: Soil
Site ID:

Project: D00282
Project Name: WILMINGTON RESERVE CNTR
Matrix: Soil
% Dry Weight: 94.
Received condition: Good
Sampler: BAILEY/BATH

Date Collected: 8/22/00
Time Collected: 14:15
Date Received: 8/23/00

Preservative:
Temperature: 3.0 degrees C
Time Received: 7:00

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures REQUIRED by the WPH/EPH method(s) were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael H. Dunn, M.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Laboratory Certification Number: 387

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures REQUIRED by the QPW/EPH method(s) were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael M. Gunn, M.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Laboratory Certification Number: 387

Page 6

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures REQUIRED by the UFN/EPN method(s) were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael H. Dunn, M.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lege, Technical Services

Laboratory Certification Number: 387

ANALYTICAL REPORT

USACE-SAVANNAH DISTRICT 8993
MARK HARVISON
100 WEST COLETHORPE AVE
SAVANNAH, GA 31402

Lab Number: 00-A112540
Sample ID: WR-88-3-00
Sample Type: Soil
Site ID:

Project: D00282
Project Name: WILMINGTON RESERVE CNTR
Matrix: Soil
% Dry Weight: 51.
Received condition: Good
Sampler: BAILEY/BATH

Date Collected: 8/22/00
Time Collected: 10:25
Date Received: 8/23/00
Preservative:
Temperature: 3.0 degrees C
Time Received: 7:00

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures REQUIRED by the EPA/EPA method(s) were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael H. Dunn, M.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Laboratory Certification Number: 387

Quality Control Summary

All samples were received in good condition, properly preserved, and properly labeled.

All analyses were completed within holding times, and all project and sample QC parameters were within acceptable limits. Elevated VFH surrogates in some samples due to sample matrix.

I certify that the data presented in this report are, to the best of my knowledge, accurate and complete.

Unadjusted hydrocarbon range data exclude concentrations of any surrogates and internal standards eluting in that range.

CERTIFICATION

ALL QA/QC procedures REQUIRED by the WPM/EPH method(s) were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael H. Dunn, M.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Laboratory Certification Number: 337

Headjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures REQUIRED by the VPM/EPH methods were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by: 
 Michael H. Dunn, M.S., Technical Dir.
 Eric Smith, Asst. Technical Dir.
 Johnny A. Mitchell, Technical Serv. Dir.
 Gail A Lage, Technical Services

Laboratory Certification Number: 387

EPH Fractionation Surr. ¹² C	74.	40. - 100.

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

ALL QA/QC procedures REQUIRED by the MPH/EPH methods were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael H. Dunn, M.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures REQUIRED by the UPH/EPA method(s) were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael M. Down, M.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Laboratory Certification Number: 337

Hal1 Surr., 1-chloro-3-fluorobenzene	94.	23. - 137.
p-Cl-3F	92.	40. - 140.
surr-o-terphenyl	109.	40. - 140.
CPM Fractionation Surr. #1	115.	40. - 140.
CPM Fractionation Surr. #2	124.	40. - 140.

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures (REQUIRED by the UPH/CPM methods) were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael H. Dunn, M.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

ANALYTICAL REPORT

Laboratory Number: 00-A119867
Sample ID: WR-MW-3-00

Page 4

No tentatively identifiable semi-volatile compounds
detected by GC/MS.

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures REQUIRED by the WPH/EPH methods were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael H. Dunn, P.E., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Laboratory Certification Number: 387

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

ALL QA/QC procedures REQUIRED by the WPH/EPH methods(s) were followed.
ALL performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael H. Dunn, N.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Laboratory Certification Number: 387

ANALYTICAL REPORT

Laboratory Number: 00-A119871
Sample ID: WR-MW-BLK-00

Page 4

No tentatively identifiable semi-volatile compounds
detected by GC/MS.

Unadjusted hydrocarbon range data exclude concentrations of any surrogate and internal standards eluting in that range.

CERTIFICATION

All QA/QC procedures REQUIRED by the UFM/EPH method(s) were followed.
All performance/acceptance standards for required QA/QC procedures were achieved.

Authorized by:

Michael H. Dunn, M.S., Technical Dir.
Eric Smith, Asst. Technical Dir.
Johnny A. Mitchell, Technical Serv. Dir.
Gail A. Lage, Technical Services

Laboratory Certification Number: 397

Mr. Kirk McDonald
North Carolina Department of Environment
and Natural Resources
Wilmington Regional Office
Division of Environmental Management
127 Cardinal Drive Extension
Wilmington, North Carolina 28405-3845

Dear Mr. McDonald:

The 81st Regional Support Command is submitting a Soil Cleanup Report of the Army Reserve facility at 2144 West Lake Shore Drive, Wilmington, NC. We believe that the results of this investigation support our claim that there is no reason to continue assessment of such a limited release at this facility. We therefore seek a finding of no further action.

Once a finding of NFA is issued, we also ask for approval to abandon and closeout the monitoring wells at this site.

If you have any questions about this request, please do not hesitate to contact Ms. Michelle Hook, Environmental Manager, Columbia, SC at (803) 751-6757 or Mr. Steven Francis, Environmental Manager, Birmingham, Alabama at (205) 795-1588.

Sincerely,

MICHAEL O'STEEN
Facility Management Officer
Deputy Chief of Staff,
Engineer

Subject: Notice of No Further Action
15A NCAC 2L .0115(h)
US Army Reserve Center-Wilmington
2144 Lake Shore Drive, New Hanover
New Hanover County
Incident No. 15294
Low Risk Classification

Dear Mr. Francis:

On January 30, 2001, the Division of Waste Management (DWM) Wilmington Regional Office received a Soil Cleanup Report with Site Closure Request for the above-referenced site. A review of the report shows that soil contamination does not exceed the soil-to-groundwater maximum soil contaminant concentrations established in 15A NCAC 2L .0115(m) or the soil cleanup levels established by the Department in the "Groundwater Section Guidelines for the Investigation and Remediation of Soil and Groundwater" (March 1997). A review of the Soil Cleanup Report with Site Closure Request also shows that contaminated groundwater does not exceed gross contamination levels that were established in 15A NCAC 2L .0115(g).

Based on information provided to date, the DWM determines that no further action is required for this incident. This determination is conditional pending completion of the public notice specified below. Once proper public notice has been given, this determination will apply unless the DWM later determines that the discharge or release poses an unacceptable risk or a potentially unacceptable risk to human health or the environment.

Please be advised that because contaminated groundwater has not been restored to the level of the standard or interim standard established in 15A NCAC 2L .0202, groundwater within the area of contamination or within the area where contamination is expected to migrate, **is not suitable** for use as a water supply.

Mr. Steve Francis

April 6, 2001

Page 2

Pursuant to 15A NCAC 2L .0115(e), you have a continuing obligation to notify the DWM of any changes that you know of or should know of, that might affect the level of risk assigned to the discharge or release. Such changes include, but are not limited to, changes in zoning of real property, use of real property or the use of groundwater that has been contaminated or is expected to be contaminated by the discharge or release, if such change could cause the DWM to reclassify the risk. Please note that this responsibility not only pertains to changes involving the property on which the release occurred, but to changes involving the surrounding properties as well.

Please be advised that you must comply with the public notice requirements of 15A NCAC 2L .0115(k) as specified below. **If public notice is not provided as required, this no further action determination will be deemed invalid.** Within **30 days** of receipt of this no further action notice, you must provide a copy of this notice to the following persons:

- local health director;
- chief administrative officer (i.e., Mayor, Chairman of the County Commissioners, County Manager, City Manager or other official of equal or similar position) of each political jurisdiction in which the contamination occurs;
- all property owners and occupants within or contiguous to the area containing contamination; and
- all property owners and occupants within or contiguous to the area where the contamination is expected to migrate.

Copies of this no further action notice must be sent to the persons listed above by certified mail. If it is impractical to provide notice by certified mail to the occupants of apartment buildings, condominiums, office buildings, etc., you may post a copy of this notice in a prominent place where the occupants are most likely to see it.

Within **60 days** of receiving this no further action notice, you must provide the DWM Wilmington Regional Office with proof of receipt of the copy of the notice or of refusal by the addressee to accept delivery of the copy of the notice. If a copy of the notice is posted, you must provide the DWM with a description of the manner in which the notice was posted.

Interested parties may examine the Soil Cleanup Report with Site Closure Request by contacting U. S. Army Corps of Engineers, Savannah District at (912) 652-5464. In addition, the DWM Wilmington Regional Office has the Soil Cleanup Report with Site Closure Request along with other site information on file and available for public review. Interested parties may arrange to review this information by contacting the regional office as listed below. In addition, comments on the Soil Cleanup Report with Site Closure Request may be submitted to the regional office.

Deborah Mayo
Wilmington Regional Office
127 Cardinal Drive Extension
Wilmington, N C 28405
(910) 395-3900

Mr. Steve Francis
April 6, 2001
Page 3

Please be advised that you must close any monitoring wells or injection wells used to investigate or remediate this incident in accordance with 15A NCAC 2C .0113 and .0214, respectively. For guidance on closure of infiltration galleries, please contact the Wilmington Regional Office.

Should you have any questions concerning this notice, please contact Deborah Mayo at (910) 395-3900.

Sincerely,

A handwritten signature in black ink, appearing to read 'D. Holsinger', with a long horizontal line extending to the right.

David Holsinger

WELL DIAGRAM: Draw a detailed sketch of the well showing total depth, depth and diameter of screens remaining in the well, gravel interval, intervals of casing perforations, and depths and types of fill materials used.

I do hereby certify that this well was abandoned in accordance with 15A NCAC 2C, well construction standards, and that a copy of the record has been provided to the well owner.

Signature of person abandoning the well _____ Date _____

WELL LOCATION: Draw a location sketch on the reverse of this sheet, showing the direction and distance of the well to at least two (2) nearby reference points such as roads, intersections and streams. Identify roads with State Highway road identification numbers.

Submit original to the Division of Water Quality, Groundwater Section, one copy to the owner within 30 days from completion of abandonment.

.0214 ABANDONMENT AND CHANGE-OF-STATUS OF WELLS

(a) In the event any injection or associated monitoring well is abandoned, either temporarily or permanently, the well owner shall notify the Director within 15 days and the well(s) shall be abandoned in accordance with one of the following procedures or other alternatives approved by the Director based on a demonstration of not adversely affecting human health or the environment:

- (1) Procedures for temporarily abandoned wells.
 - (A) Upon temporary removal from service, or prior to being put into service, the well shall be sealed with a water-tight cap or seal compatible with the casing and installed so that it cannot be removed without the use of hand or powers tools.
 - (B) The well shall be maintained whereby it is not a source or channel of contamination to an underground source of drinking water during its temporary status.
 - (C) The well shall be repaired, to achieve compliance with the Rules in this Section, or permanently abandoned within 30 days of receipt of notice from the department, upon finding that a well is acting as a source or channel of contamination to an underground source of drinking water.
 - (2) Procedures for permanently abandoned wells.
 - (A) All casing and materials may be removed prior to initiation of abandonment procedures if the Director finds such removal will not be responsible for, or contribute to, the contamination of an underground source of drinking water. Any casing not grouted in accordance with 15A NCAC 2C .0113 shall be removed or properly grouted.
 - (B) The entire depth of the well shall be sounded before it is sealed to insure freedom from obstructions that may interfere with sealing operations.
 - (C) The well shall be thoroughly disinfected, prior to sealing, if the Director determines that failure to do so could lead to the contamination of an underground source of drinking water.
 - (D) Drilled wells shall be completely filled with cement grout, which shall be introduced into the well through a pipe which extends to the bottom of the well and is raised as the well is filled. "Bored" or hand-dug wells over 24 inches in diameter may be filled with an alternative material approved by the Director based on a demonstration of not adversely affecting human health or the environment.
 - (E) In the case of gravel-packed wells in which the casing and screens have not been removed, neat cement shall be injected into the well completely filling it from the bottom of the casing to the top.
 - (F) In those cases when, as a result of the injection operations, a subsurface cavity has been created, the well shall be abandoned in such a manner that will prevent the movement of fluids into or between underground sources of drinking water and in accordance with the terms and conditions of the permit.
- (b) Exploratory or test wells, constructed for the purposes of obtaining information regarding an injection well site, shall be ~~permanently~~ abandoned in accordance with Subparagraph (2) of this Rule upon completion of their exploratory or testing status.
- (c) An injection well shall be ~~permanently~~ abandoned by the drilling contractor before removing his equipment from the site if the well casing has not been installed or has been removed from the well bore.

REPLY TO
ATTENTION OF

Deputy Chief of Staff, Engineer

Wilmington City Council
Post Office Box 1810
Wilmington, North Carolina 28402

Dear Sir or Madame:

The purpose of this letter is to notify you that the North Carolina Division of Water Quality (DWQ) has received a Soil Cleanup Report and issued a finding of No Further Action (NFA) for the Adrian B. Rhodes Armed Forces Reserve Center (AFRC) located at 2144 West Lake Shore Drive, across from Greenfield Lake. The site is currently owned by the Department of the Army, 81st Regional Support Command (RSC). A copy of the NFA letter received by DWQ is included for your review. Because the property that you own or occupy is located within or contiguous to the area, State rules require that you be notified.

In 1993, the 81st RSC removed four underground storage tanks (USTs), which had contained heating oil for the facility. One of the USTs leaked an undetermined amount of heating oil. The area of contamination extended approximately 120 feet across the site, but did not leave the AFRC property. Remediation efforts included the excavation and removal of approximately 500 cubic yards of soil.

In August 2000, post remediation sampling indicated the soil contained no chemicals of concern related to the site. Post remediation groundwater samples indicated low levels of petroleum contamination are still present. Comparing the data to previous groundwater sampling events, it is evident that the contamination levels are continuing to decrease.

If you would like to examine the Soil Cleanup Report, please contact Steven M. Bath of the Corps of Engineers, Savannah District at (912) 652-5464. A copy will be mailed to you promptly. In addition, the North Carolina Department of Environmental and Natural Resources (NCDENR), Wilmington Regional Office has the Soil Cleanup Report along with other site information on file that is available for public review. You may make copies of this information for a small fee. Any written comments concerning this request should be submitted to the following address within thirty (30) days of the date that this letter was issued:

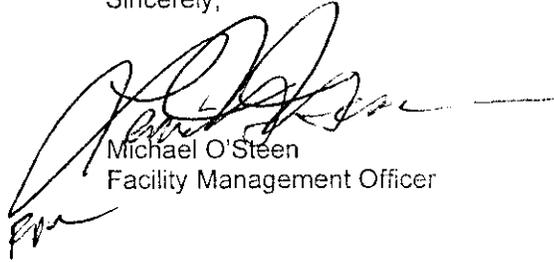

Deborah Mayo
NCDENR, Wilmington Regional Office
127 Cardinal Drive Extension
Wilmington, NC 28405
(910) 395-3900

All comments received within this time frame will be considered by DWQ in approving the request for finalization of the NFA. Deborah Mayo may be contacted during normal weekday business hours to answer questions or to arrange an appointment to review the information on file pertaining to the Soil Cleanup Report. Notification of this request for approval of a NFA is also being made by certified mail to Mr. Dave Rice, Health Director, New Hanover County Health Department; Mr. David L. Jones, Mayor of Wilmington; Ms. Mary M. Wilmington, North Carolina 28401

Dear Sir or Madame:

The purpose of this letter is to notify you that the North Carolina Division of Water Quality (DWQ) has received a Soil Cleanup Report and issued a finding of No Further Action (NFA) for the Adrian B. Rhodes Armed Forces Reserve Center (AFRC) located at 2144 West Lake Shore Drive, across from Greenfield Lake. The site is currently owned by the Department of the Army, 81st Regional Support Command (RSC). A copy of the NFA letter received by DWQ is included for your review. Because the property that you own or occupy is located within or contiguous to the area, State rules require that you be notified.

In 1993, the 81st RSC removed four underground storage tanks (USTs), which had contained heating oil for the facility. One of the USTs leaked an undetermined amount of heating oil. The area of contamination extended approximately 120 feet across the site, but did not leave the AFRC property. Remediation efforts included the excavation and removal of approximately 500 cubic yards of soil.

In August 2000, post remediation sampling indicated the soil contained no chemicals of concern related to the site. Post remediation groundwater samples indicated low levels of petroleum contamination are still present. Comparing the data to previous groundwater sampling events, it is evident that the contamination levels are continuing to decrease.

If you would like to examine the Soil Cleanup Report, please contact Steven M. Bath of the Corps of Engineers, Savannah District at (912) 652-5464. A copy will be mailed to you promptly. In addition, the North Carolina Department of Environmental and Natural Resources (NCDENR), Wilmington Regional Office has the Soil Cleanup Report along with other site information on file that is available for public review. You may make copies of this information for a small fee. Any written comments concerning this request should be submitted to the following address within thirty (30) days of the date that this letter was issued:

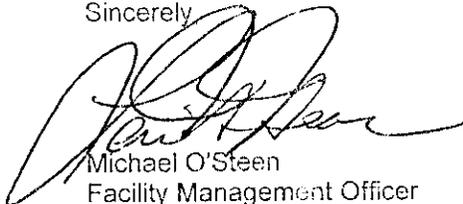

Deborah Mayo
NCDENR, Wilmington Regional Office
127 Cardinal Drive Extension
Wilmington, NC 28405
(910) 395-3900

All comments received within this time frame will be considered by DWQ in approving the request for finalization of the NFA. Deborah Mayo may be contacted during normal weekday business hours to answer questions or to arrange an appointment to review the information on file pertaining to the Soil Cleanup Report. Notification of this request for approval of a NFA is also being made by certified mail to Mr. Dave Rice, Health Director, New Hanover County Health Department; Mr. David L. Jones, Mayor of Wilmington; Ms. Mary M. Gornito, Wilmington City Manager; Mr. Allen O'Neal, County Manager, New Hanover County; Ms. Delilah Blanks, President, North Carolina Association of County Commissioners; and other property owners and occupants within or near the source area.

Dear Ms. Mayo:

Reference is made to your letter dated 6 April 2001, to the 81st Regional Support Command (RSC), subject Notice of No Further Action (NFA), 15A NCAC 2L .0115(h), copy enclosed. In accordance with the requirements stated in your letter, the 81st RSC has notified the following personnel of any potential contamination: Mr. Dave Rice, Health Director, New Hanover County Health Department; Mr. David L. Jones, Mayor of Wilmington; Ms. Mary M. Gornto, Wilmington City Manager; Mr. Allen O'Neal, County Manager, New Hanover County; Ms. Delilah Blank, President, North Carolina Association of County Commissioners; and the private resident at 2012 West Lake Shore. Also enclosed is a copy of the certified letter sent by the 81st RSC and a copy of the certified mail receipt cards.

We believe that we have completed all the requirements of the NFA. Therefore, request that the NFA be finalized for this site. If you have any questions about this request, please do not hesitate to contact Mr. Steven Francis, Environmental Manager, at toll free (877) 749-9063, ext. 1588.

Subject: Notice of No Further Action
15A NCAC 2L .0115(h)
US Army Reserve Center-Wilmington
2144 Lake Shore Drive, New Hanover
New Hanover County
Incident No. 15294
Low Risk Classification

Dear Mr. Francis:

On January 30, 2001, the Division of Waste Management (DWM) Wilmington Regional Office received a Soil Cleanup Report with Site Closure Request for the above-referenced site. A review of the report shows that soil contamination does not exceed the soil-to-groundwater maximum soil contaminant concentrations established in 15A NCAC 2L .0115(m) or the soil cleanup levels established by the Department in the "Groundwater Section Guidelines for the Investigation and Remediation of Soil and Groundwater" (March 1997). A review of the Soil Cleanup Report with Site Closure Request also shows that contaminated groundwater does not exceed gross contamination levels that were established in 15A NCAC 2L .0115(g).

Based on information provided to date, the DWM determines that no further action is required for this incident. This determination is conditional pending completion of the public notice specified below. Once proper public notice has been given, this determination will apply unless the DWM later determines that the discharge or release poses an unacceptable risk or a potentially unacceptable risk to human health or the environment.

Please be advised that because contaminated groundwater has not been restored to the level of the standard or interim standard established in 15A NCAC 2L .0202, groundwater within the area of contamination or within the area where contamination is expected to migrate, **is not suitable** for use as a water supply.

Mr. Steve Francis
April 6, 2001
Page 2

Pursuant to 15A NCAC 2L .0115(e), you have a continuing obligation to notify the DWM of any changes that you know of or should know of, that might affect the level of risk assigned to the discharge or release. Such changes include, but are not limited to, changes in zoning of real property, use of real property or the use of groundwater that has been contaminated or is expected to be contaminated by the discharge or release, if such change could cause the DWM to reclassify the risk. Please note that this responsibility not only pertains to changes involving the property on which the release occurred, but to changes involving the surrounding properties as well.

Please be advised that you must comply with the public notice requirements of 15A NCAC 2L .0115(k) as specified below. **If public notice is not provided as required, this no further action determination will be deemed invalid.** Within **30 days** of receipt of this no further action notice, you must provide a copy of this notice to the following persons:

- local health director;
- chief administrative officer (i.e., Mayor, Chairman of the County Commissioners, County Manager, City Manager or other official of equal or similar position) of each political jurisdiction in which the contamination occurs;
- all property owners and occupants within or contiguous to the area containing contamination; and
- all property owners and occupants within or contiguous to the area where the contamination is expected to migrate.

Copies of this no further action notice must be sent to the persons listed above by certified mail. If it is impractical to provide notice by certified mail to the occupants of apartment buildings, condominiums, office buildings, etc., you may post a copy of this notice in a prominent place where the occupants are most likely to see it.

Within **60 days** of receiving this no further action notice, you must provide the DWM Wilmington Regional Office with proof of receipt of the copy of the notice or of refusal by the addressee to accept delivery of the copy of the notice. If a copy of the notice is posted, you must provide the DWM with a description of the manner in which the notice was posted.

Interested parties may examine the Soil Cleanup Report with Site Closure Request by contacting U. S. Army Corps of Engineers, Savannah District at (912) 652-5464. In addition, the DWM Wilmington Regional Office has the Soil Cleanup Report with Site Closure Request along with other site information on file and available for public review. Interested parties may arrange to review this information by contacting the regional office as listed below. In addition, comments on the Soil Cleanup Report with Site Closure Request may be submitted to the regional office.

Deborah Mayo
Wilmington Regional Office
127 Cardinal Drive Extension
Wilmington, N C 28405
(910) 395-3900

Mr. Steve Francis
April 6, 2001
Page 3

Please be advised that you must close any monitoring wells or injection wells used to investigate or remediate this incident in accordance with 15A NCAC 2C .0113 and .0214, respectively. For guidance on closure of infiltration galleries, please contact the Wilmington Regional Office.

Should you have any questions concerning this notice, please contact Deborah Mayo at (910) 395-3900.

Sincerely,

David Holsinger
UST Regional Supervisor

WELL LOCATION: Draw a location sketch on the reverse of this sheet, showing the direction and distance of the well to at least two (2) nearby reference points such as roads, intersections and streams. Identify roads with State Highway road identification numbers.

Submit original to the Division of Water Quality, Groundwater Section, one copy to the owner within 30 days from completion of abandonment.

.0214 ABANDONMENT AND CHANGE-OF-STATUS OF WELLS

(a) In the event any injection or associated monitoring well is abandoned, either temporarily or permanently, the well owner shall notify the Director within 15 days and the well(s) shall be abandoned in accordance with one of the following procedures or other alternatives approved by the Director based on a demonstration of not adversely affecting human health or the environment:

- (1) Procedures for temporarily abandoned wells.
 - (A) Upon temporary removal from service, or prior to being put into service, the well shall be sealed with a water-tight cap or seal compatible with the casing and installed so that it cannot be removed without the use of hand or power tools.
 - (B) The well shall be maintained whereby it is not a source or channel of contamination to an underground source of drinking water during its temporary status.
 - (C) The well shall be repaired, to achieve compliance with the Rules in this Section, or permanently abandoned within 30 days of receipt of notice from the department, upon finding that a well is acting as a source or channel of contamination to an underground source of drinking water.
- (2) Procedures for permanently abandoned wells.
 - (A) All casing and materials may be removed prior to initiation of abandonment procedures if the Director finds such removal will not be responsible for, or contribute to, the contamination of an underground source of drinking water. Any casing not grouted in accordance with 15A NCAC 2C .0113 shall be removed or properly grouted.
 - (B) The entire depth of the well shall be sounded before it is sealed to insure freedom from obstructions that may interfere with sealing operations.
 - (C) The well shall be thoroughly disinfected, prior to sealing, if the Director determines that failure to do so could lead to the contamination of an underground source of drinking water.
 - (D) Drilled wells shall be completely filled with cement grout, which shall be introduced into the well through a pipe which extends to the bottom of the well and is raised as the well is filled. "Bored" or hand-dug wells over 24 inches in diameter may be filled with an alternative material approved by the Director based on a demonstration of not adversely affecting human health or the environment.
 - (E) In the case of gravel-packed wells in which the casing and screens have not been removed, neat cement shall be injected into the well completely filling it from the bottom of the casing to the top.
 - (F) In those cases when, as a result of the injection operations, a subsurface cavity has been created, the well shall be abandoned in such a manner that will prevent the movement of fluids into or between underground sources of drinking water and in accordance with the terms and conditions of the permit.

(b) Exploratory or test wells, constructed for the purposes of obtaining information regarding an injection well site, shall be ~~permanently~~ abandoned in accordance with Subparagraph (2) of this Rule upon completion of their exploratory or testing status.

(c) An injection well shall be ~~permanently~~ abandoned by the drilling contractor before removing his equipment from the site if the well casing has not been installed or has been removed from the well bore.

.0113 ABANDONMENT OF WELLS

(a) Any well which has been abandoned, either temporarily or permanently, shall be abandoned in accordance with one of the following procedures:

(1) Procedures for temporary abandonment of wells:

(A) Upon temporary removal from service or prior to being put into service, the well shall be sealed with a water-tight cap or seal compatible with casing and installed so that it cannot be removed easily by hand.

(B) The well shall be maintained whereby it is not a source or channel or contamination during temporary abandonment.

(C) Every temporarily abandoned well shall be protected with a casing.

(2) Procedures for permanent abandonment of wells:

(A) All casing and screen materials may be removed prior to initiation of abandonment procedures if such removal will not cause or contribute to contamination of the groundwaters. Any casing not grouted in accordance with Rule .0107 Paragraph (e) of this Section shall be removed or properly grouted.

(B) The entire depth of the well shall be sounded before it is sealed to ensure freedom from obstructions that may interfere with sealing operations.

(C) The well shall be thoroughly disinfected prior to sealing.

(D) In the case of gravel-packed wells in which the casing and screens have not been removed, neat-cement shall be injected into the well completely filling it from the bottom of the casing to the top.

(E) "Bored" wells shall be completely filled with cement grout, dry clay or material excavated during drilling of the well and then compacted in place.

(F) Wells, other than "bored" wells, constructed in unconsolidated formations shall be completely filled with cement grout by introducing it through a pipe extending to the bottom of the well which can be raised as the well is filled.

(G) Wells constructed in consolidated rock formations or that penetrate zones of consolidated rock may be filled with cement, sand, gravel or drill cuttings opposite the zones of consolidated rock. The top of the sand, gravel or cutting fill shall be at least five feet below the top of the consolidated rock. The remainder of the well shall be filled with cement grout only.

(H) Test wells less than 20 feet in depth which do not penetrate the water table shall be abandoned in such manner as to prevent the well from being a channel allowing the vertical movement of water or a source of contamination to the groundwater supply. Test wells or borings that penetrate the water table shall be abandoned by completely filling with cement grout.

(b) Any well which acts as a source or channel of contamination shall be repaired or permanently abandoned within 30 days of receipt of notice from the department.

(c) The drilling contractor shall permanently abandon any well in which the casing has not been installed or from which the casing has been removed, prior to removing his equipment from the site.

(d) The owner shall be responsible for permanent abandonment of a well except:

(1) As otherwise specified in these Rules; or

(2) If well abandonment is required because the driller improperly locates, constructs, or completes the well.

History Note: Statutory Authority G.S. 87-87; 87-88;

Eff. February 1, 1976;

Amended Eff. December 1, 1992; September 1, 1984; April 20, 1978.

The notice must describe the nature of the proposed remediation and the reasons supporting it. The format of the notice is provided in Section 11.3.

11.2 Public Notice Required After Receiving Notification of Site Closure
[15A NCAC 2L .0115(k)]

Once a discharge or release is classified as low risk and soil contamination has been cleaned up to applicable cleanup levels, the DWQ Regional Office will issue a notice to the responsible party specifying that no further action is required in accordance with 15A NCAC 2L .0115(h). If the discharge or release has not been remediated to the standards or interim standards established under 15A NCAC 2L .0202 or to the lower of the residential or soil-to-groundwater maximum soil contaminant concentrations, the responsible party must provide public notice in accordance with 15A NCAC 2L .0115(k).

Within 30 days of receiving a no further action notice, the responsible party must provide a copy of the notice to the following:

- the local health director;
- the chief administrative officer of each political jurisdiction in which the contamination occurs;
- all property owners and occupants within or contiguous to the area containing contamination; and
- all property owners and occupants within or contiguous to the area where the contamination is expected to migrate.

The notice must be made by certified mail.

NOTE: *The chief administrative officer is considered to be the Mayor, Chairman of the County Commissioners, County Manager, City Manager or other official of equal or similar position.*

It may be impractical to provide the no further action notice by certified mail to the occupants of apartment buildings, condominiums, office buildings, etc. In these cases, the responsible party may post the notice in a prominent place where the occupants are most likely to see it. A public meeting may be held should the Director find a significant degree of public interest in the proposed closure.

Within 60 days of receiving the no further action notice, the responsible party must provide the DWQ Regional Office with proof of receipt of the copy of the notice or of refusal by the addressee to accept delivery of the copy of the notice. If notice is posted, the responsible party must provide the DWQ with a description of the manner in which the posted notice was given. Site closure will be conditional until proper notice has been made.

11.3 Format of Public Notice Pursuant to 15A NCAC 2L .0115(j)

A. Public Notice to an Individual

The following is the format to be used by a responsible party for providing individual public notice in accordance with 15A NCAC 2L .0115(j).

*[Name and address of person
Required to be notified under 15A NCAC 2L .0115(j)]*

Subject: Notice of Request for Approval of
a *Corrective Action Plan, Soil Assessment
Report, or Soil Cleanup Plan*

*Site name
Address
County
Incident No.*

Dear *(Name of Property Owner/Occupant)*:

This letter is to inform you that the NC Division of Water Quality (DWQ) has received a request for approval of a proposal to cleanup a discharge or release from a petroleum underground storage tank system located in your area. Because the property that you own or occupy is located within or contiguous to an area containing contamination or within or contiguous to an area where the contamination is expected to migrate, the State rules governing groundwater classifications and standards (15A NCAC 2L .0115), require that you be informed of the proposed activities.

(Name of Environmental Consultant) on behalf of the responsible party *(Name of responsible party)* is providing notice of the request for approval of a *(Corrective Action Plan, Soil Assessment Report, or Soil Cleanup Plan)* that proposes: *(Choose all that apply)*

- *To use natural processes of degradation and attenuation as a method to cleanup contaminated groundwater;*
- *To cleanup groundwater contamination to a standard other than the groundwater standard or interim standard established in 15A NCAC 2L .0202; and*
- *To cleanup soil contamination to a standard other than the residential or soil-to-groundwater maximum contaminant concentration, whichever is lower.*

The source area of the contamination is located at *[Give the location of the source area of the discharge or release using at least two street names/numbers. If this is not feasible, use the name/number of one road and the distance to an identified landmark (e.g., named body of water, historic site, park, or federal land) on the NCDOT county map.]* Please see the attached map showing the location of the source area of the discharge or release and the location of your property.

(Describe the cleanup proposal and provide the reasons supporting it. Include a discussion of how the public health and environment is protected and cite any additional reasons why this proposal should be relied on to reduce the risk posed by the discharge or release.)

If you would like to examine the plan, please contact *(contact person for the proponent of the plan)* at *(area code and telephone number)*. A copy will be mailed to you promptly. In addition, the DWQ *(name of appropriate Regional Office)* has the *(Corrective action Plan, Soil Assessment Report, or Soil Cleanup Plan)* along with other site information on file and available for public review. You may make copies of this information for a small fee. Any written comments concerning this request should be submitted to the following address within thirty (30) days of the date that this letter was issued:

(DWQ Regional Office project manager)
(Appropriate Regional Office)
(Regional Office address and zip code)
(Regional Office telephone number)

All comments received within this time frame will be considered in approving the *(Corrective Action Plan, Soil Assessment Report, or Soil Cleanup Plan)*. A public meeting may be held should the Director of the DWQ find a significant degree of public interest in the proposed activities.

(Name of Regional Office staff person) may be contacted during normal weekday business hours to answer questions or to arrange an appointment to review the information on file pertaining to the discharge or release. Notification of this request for approval of a *(Corrective action Plan, Soil Assessment Report, or Soil Cleanup Plan)* is also being made by certified mail to *(name and title of local Health Director)*, *(name and title of Chief Administrative Officer)*, and other property owners and occupants within or near the source area of the discharge or release.

Sincerely,

(Environmental Consultant name and title)

Attachment: Scaled site map showing source area of discharge or release and location of property owned or occupied by person being notified.

B. Public Notice by Posting

The following is the format to be used by a responsible party posting notice in accordance with 15A NCAC 2L .0115(j).

PUBLIC NOTICE

NOTIFICATION OF PROPOSED CLEANUP OF A DISCHARGE OR RELEASE FROM A PETROLEUM UNDERGROUND STORAGE TANK SYSTEM

Site name
Address
County
Incident No.

In accordance with 15A NCAC 2L .0115(j), public notice is hereby given of receipt of a request for approval by the North Carolina Division of Water Quality of a (*Corrective Action Plan, Soil Assessment Report, or Soil Cleanup Plan*) for the above-referenced site. The (*Corrective Action Plan, Soil Assessment Report, or Soil Cleanup Plan*) proposes: (*Choose all that apply*)

- *To use natural processes of degradation and attenuation as a method to cleanup contaminated groundwater;*
- *To cleanup groundwater contamination to a standard other than the groundwater standard or interim standard established in 15A NCAC 2L .0202; and*
- *To cleanup soil contamination to a standard other than the residential or soil-to-groundwater maximum contaminant concentration, whichever is lower.*

Interested parties may examine the (*Corrective Action Plan, Soil Assessment Report, or Soil Cleanup Plan*) by contacting (*contact person for the proponent of the plan*) at (*area code and telephone number*). In addition, the DWQ (*name of appropriate Regional Office*) has the (*Corrective Action Plan, Soil Assessment Report, or Soil Cleanup Plan*) along with other site information on file and available for public review. You may arrange to review this information by contacting the Regional Office listed below.

Any written comments concerning this request should be submitted to the following address within thirty (30) days of the date that this notice was posted:

(DWQ Regional Office project manager)
(Appropriate Regional Office)
(Regional Office address and zip code)
(Regional Office telephone number)

.0113 ABANDONMENT OF WELLS

- (a) Any well which has been abandoned, either temporarily or permanently, shall be abandoned in accordance with one of the following procedures:
- (1) Procedures for temporary abandonment of wells:
 - (A) Upon temporary removal from service or prior to being put into service, the well shall be sealed with a water-tight cap or seal compatible with casing and installed so that it cannot be removed easily by hand.
 - (B) The well shall be maintained whereby it is not a source or channel of contamination during temporary abandonment.
 - (C) Every temporarily abandoned well shall be protected with a casing.
 - (2) Procedures for permanent abandonment of wells:
 - (A) All casing and screen materials may be removed prior to initiation of abandonment procedures if such removal will not cause or contribute to contamination of the groundwaters. Any casing not grouted in accordance with Rule .0107 Paragraph (e) of this Section shall be removed or properly grouted.
 - (B) The entire depth of the well shall be sounded before it is sealed to ensure freedom from obstructions that may interfere with sealing operations.
 - (C) The well shall be thoroughly disinfected prior to sealing.
 - (D) In the case of gravel-packed wells in which the casing and screens have not been removed, neat-cement shall be injected into the well completely filling it from the bottom of the casing to the top.
 - (E) "Bored" wells shall be completely filled with cement grout, dry clay or material excavated during drilling of the well and then compacted in place.
 - (F) Wells, other than "bored" wells, constructed in unconsolidated formations shall be completely filled with cement grout by introducing it through a pipe extending to the bottom of the well which can be raised as the well is filled.
 - (G) Wells constructed in consolidated rock formations or that penetrate zones of consolidated rock may be filled with cement, sand, gravel or drill cuttings opposite the zones of consolidated rock. The top of the sand, gravel or cutting fill shall be at least five feet below the top of the consolidated rock. The remainder of the well shall be filled with cement grout only.
 - (H) Test wells less than 20 feet in depth which do not penetrate the water table shall be abandoned in such manner as to prevent the well from being a channel allowing the vertical movement of water or a source of contamination to the groundwater supply. Test wells or borings that penetrate the water table shall be abandoned by completely filling with cement grout.
- (b) Any well which acts as a source or channel of contamination shall be repaired or permanently abandoned within 30 days of receipt of notice from the department.
- (c) The drilling contractor shall permanently abandon any well in which the casing has not been installed or from which the casing has been removed, prior to removing his equipment from the site.
- (d) The owner shall be responsible for permanent abandonment of a well except:
- (1) As otherwise specified in these Rules; or
 - (2) If well abandonment is required because the driller improperly locates, constructs, or completes the well.

RE: Oil water separator Investigation
Adrian B. Rhodes Armed Forces Reserve Center
2144 West Lakeshore Drive
Wilmington, New Hanover County, North Carolina

Dear Ms. Hook:

On November 11, 2006 SEI Environmental mobilized to the site located at 2144 West Lakeshore Drive, Wilmington, North Carolina to collect soil samples associated with an underground oil water separator.

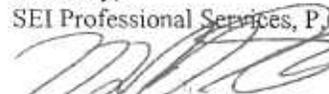

A Geoprobe direct push sampler was used to advance two (SB-1-3' and SB-2-3') soil borings around the oil water separator system. One soil sample was collected from both ends of the tank at depth of three feet. Groundwater was detected at a depth of 4.5 feet. The soil encountered in the borings was semi-course organic tan sand.

The soil samples were placed into laboratory supplied, clean containers, sealed with a Teflon lined cap, placed in an iced cooler, maintained at 4°C and submitted under chain-of-custody procedures to Accutest Laboratories. A total of two soil samples were submitted for analysis by EPA method 418.1.

Laboratory analytical results indicate that petroleum hydrocarbons were not detected above reportable limits in SB-1-3' and SB-2-3'. Sample analytical results are summarized in Table 1. A site map showing the location of the soil borings and analytical results is included in Figure 1. A copy of the laboratory report is included in Appendix A.

SEI Professional Services, P.C. appreciates the opportunity for you business. If you have any questions or comments, please do not hesitate to contact me at (704) 596-8624.

Sincerely,
SEI Professional Services, P.C.

Michael D. Shaw, P.G.

EDR City Directory Abstract

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening report designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Thank you for your business.

Please contact EDR at 1-800-352-0050
with any questions or comments.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. **NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OR DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT.**

Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

SUMMARY

- ***City Directories:***

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1964 through 2005. (These years are not necessarily inclusive.) A summary of the information obtained is provided in the text of this report.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified.

EXECUTIVE SUMMARY

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.

Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STATE AND LOCAL RECORDS

HSDS: The Hazardous Substance Disposal Sites list contains locations of uncontrolled and unregulated hazardous waste sites. The file contains sites on the national priority list as well as the state priority list. The data source is the North Carolina Center for Geographic Information and Analysis.

A review of the NC HSDS list, as provided by EDR, and dated 06/21/1995 has revealed that there is 1 NC HSDS site within approximately 1 mile of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Dist / Dir</u>	<u>Map ID</u>	<u>Page</u>
SOUTHERN WOOD PIEDMONT CO#		1/2 - 1 NW	0	9

IMD: Incident Management Database.

A review of the IMD list, as provided by EDR, and dated 04/01/2006 has revealed that there are 3 IMD sites within approximately 0.5 miles of the target property.

<u>Equal/Higher Elevation</u>	<u>Address</u>	<u>Dist / Dir</u>	<u>Map ID</u>	<u>Page</u>
<i>FAST FARE # 730</i>	<i>2158 CAROLINA BEACH</i>	<i>1/4 - 1/2 WSW</i>	<i>3</i>	<i>9</i>

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 04/19/2006	Source: EPA
Date Data Arrived at EDR: 05/05/2006	Telephone: N/A
Date Made Active in Reports: 05/22/2006	Last EDR Contact: 08/02/2006
Number of Days to Update: 17	Next Scheduled EDR Contact: 10/30/2006
	Data Release Frequency: Quarterly

	Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

NPL RECOVERY: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991	Source: EPA
Date Data Arrived at EDR: 02/02/1994	Telephone: 202-564-4267
Date Made Active in Reports: 03/30/1994	Last EDR Contact: 05/23/2006
Number of Days to Update: 56	Next Scheduled EDR Contact: 08/21/2006
	Data Release Frequency: No Update Planned

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 02/01/2006	Source: EPA
Date Data Arrived at EDR: 03/21/2006	Telephone: 703-413-0223
Date Made Active in Reports: 04/13/2006	Last EDR Contact: 06/22/2006
Number of Days to Update: 23	Next Scheduled EDR Contact: 09/18/2006
	Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Date of Government Version: 02/01/2006	Source: EPA
Date Data Arrived at EDR: 03/21/2006	Telephone: 703-413-0223

Number of Days to Update: 27	Next Scheduled EDR Contact: 09/04/2006
	Data Release Frequency: Quarterly

RCRA: Resource Conservation and Recovery Act Information

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 03/09/2006	Source: EPA

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients--States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Date of Government Version: 04/26/2006	Source: Environmental Protection Agency

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

Date of Government Version: 11/04/2005	Source: Department of Energy
Date Data Arrived at EDR: 11/28/2005	Telephone: 505-845-0011

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

FINDS: Facility Index System/Facility Registry System

Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 04/27/2006	Source: EPA
Date Data Arrived at EDR: 05/02/2006	Telephone: N/A
Date Made Active in Reports: 05/30/2006	Last EDR Contact: 04/03/2006
Number of Days to Update: 28	Next Scheduled EDR Contact: 07/03/2006
	Data Release Frequency: Quarterly

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995	Source: EPA
Date Data Arrived at EDR: 07/03/1995	Telephone: 202-564-4104

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.

Telephone: 312-280-5991

The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services

Telephone: 410-786-3000

A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health

Telephone: 301-594-6248

Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools

Source: National Center for Education Statistics

Telephone: 202-502-7300

Longitude (West):	77.9356 - 77° 56' 8.2"
Universal Tranverse Mercator:	Zone 18
UTM X (Meters):	229503.1
UTM Y (Meters):	3788466.8
Elevation:	8 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	34077-B8 WILMINGTON, NC
Most Recent Revision:	1998

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

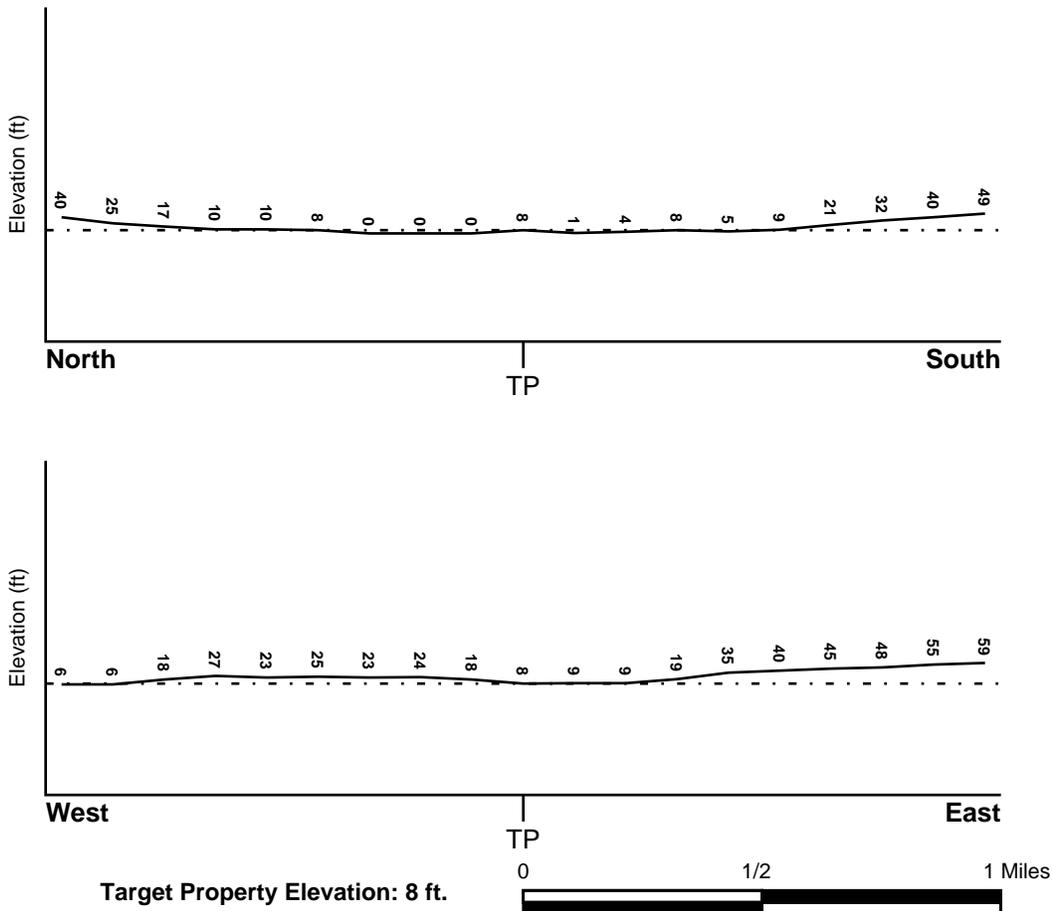

TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General ENE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

<u>Target Property County</u> NEW HANOVER, NC	<u>FEMA Flood Electronic Data</u> YES - refer to the Overview Map and Detail Map
Flood Plain Panel at Target Property:	3701710010B
Additional Panels in search area:	3701710005C

NATIONAL WETLAND INVENTORY

<u>NWI Quad at Target Property</u> WILMINGTON	<u>NWI Electronic Data Coverage</u> YES - refer to the Overview Map and Detail Map
--	---

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

<u>MAP ID</u>	<u>LOCATION FROM TP</u>	<u>GENERAL DIRECTION GROUNDWATER FLOW</u>
Not Reported		

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era: Cenozoic
System: Quaternary
Series: Pleistocene
Code: Qp (decoded above as Era, System & Series)

GEOLOGIC AGE IDENTIFICATION

Category: Stratified Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name: KUREB

Soil Surface Texture: sand

Hydrologic Group: Class A - High infiltration rates. Soils are deep, well drained to excessively drained sands and gravels.

Soil Drainage Class: Excessively. Soils have very high and high hydraulic conductivity and low water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: LOW

Depth to Bedrock Min: > 60 inches

Depth to Bedrock Max: > 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
Layer	Boundary		Soil Texture Class	Classification		Permeability Rate (in/hr)	Soil Reaction (pH)
	Upper	Lower		AASHTO Group	Unified Soil		
1	0 inches	80 inches	sand	Granular materials (35 pct. or less passing No. 200), Fine Sand.	COARSE-GRAINED SOILS, Sands, Clean Sands, Poorly graded sand.	Max: 20.00 Min: 6.00	Max: 7.30 Min: 3.60

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: muck
fine sand

Surficial Soil Types: muck
fine sand

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: loamy sand

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)

Source: United States Geologic Survey

EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)

Source: United States Geologic Survey

A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetlands Inventory

Source: Department of Environment & Natural Resources

Telephone: 919-733-2090

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System

Source: EDR proprietary database of groundwater flow information

EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Services

The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database

Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)

Telephone: 800-672-5559

SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data

Source: EPA/Office of Drinking Water

Telephone: 202-564-3750

Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)

This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

Telephone: 919-715-3243

OTHER STATE DATABASE INFORMATION

NC Natural Areas: Significant Natural Heritage Areas

Source: Center for Geographic Information and Analysis

Telephone: 919-733-2090

A polygon coverage identifying sites (terrestrial or aquatic that have particular biodiversity significance.

A site's significance may be due to the presence of rare species, rare or high quality natural communities, or other important ecological features.

NC Game Lands: Wildlife Resources Commission Game Lands

Source: Center for Geographic Information and Analysis

Telephone: 919-733-2090

All publicly owned game lands managed by the North Carolina Wildlife Resources Commission and as listed in Hunting and Fishing Maps.

NC Natural Heritage Sites: Natural Heritage Element Occurrence Sites

Source: Center for Geographic Information and Analysis

Telephone: 919-733-2090

A point coverage identifying locations of rare and endangered species, occurrences of exemplary or unique natural ecosystems (terrestrial or aquatic), and special animal habitats (e.g., colonial waterbird nesting sites).
